(54) Title: STABILIZED ORAL PHARMACEUTICAL COMPOSITION

(57) Abstract: An orally deliverable pharmaceutical composition is provided comprising an aminosulfonyl-comprising drug, for example a selective cyclooxygenase-2 inhibitory drug such as celecoxib, and a solvent liquid comprising a polyethylene glycol and one or more free radical-scavenging antioxidants. At least a substantial part of the drug is in dissolved form in the solvent liquid. The composition has rapid-onset properties and is useful in treatment of cyclooxygenase-2 mediated conditions and disorders.

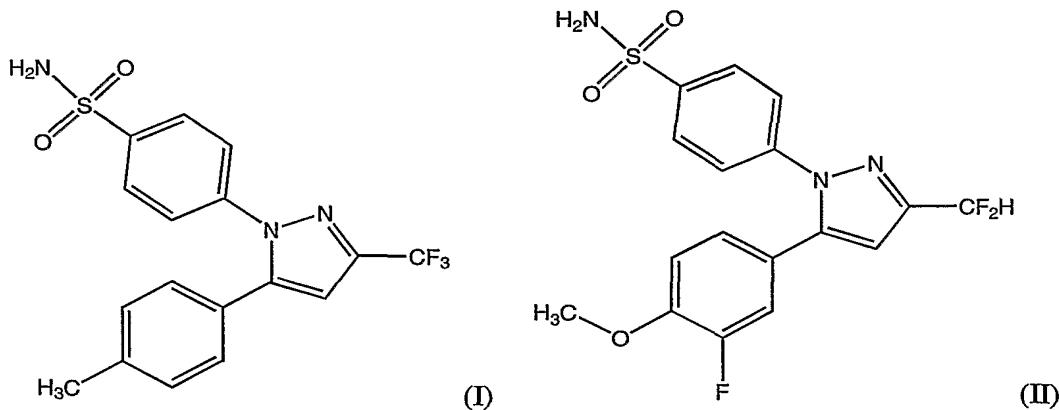

## STABILIZED ORAL PHARMACEUTICAL COMPOSITION

## FIELD OF THE INVENTION

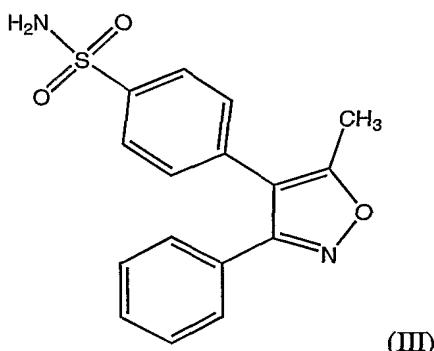

The present invention relates to orally deliverable pharmaceutical compositions that comprise a drug of low water solubility, more particularly to such compositions where the drug is in dissolved form.

## BACKGROUND OF THE INVENTION

Several compounds having a molecular structure that comprises an aminosulfonyl functional group (herein referred to as aminosulfonyl-comprising compounds) have been reported as having therapeutically and/or prophylactically useful selective cyclooxygenase-2 (COX-2) inhibitory effects, and have been disclosed as having utility in treatment or prevention of specific COX-2 mediated disorders or of such disorders in general. Among such compounds are a large number of substituted pyrazolyl benzenesulfonamides as reported in U.S. Patent No. 5,760,068 to Talley *et al.*, including for example the compound 4-[5-(4-methylphenyl)-3-(trifluoromethyl)-1H-pyrazol-1-yl]benzenesulfonamide, also referred to herein as celecoxib (I), and the compound 4-[5-(3-fluoro-4-methoxyphenyl)-3-difluoromethyl)-1H-pyrazol-1-yl]benzenesulfonamide, also referred to herein as deracoxib (II).

20 Other aminosulfonyl-comprising compounds reported to have therapeutically and/or prophylactically useful selective COX-2 inhibitory effect are substituted isoxazolyl benzenesulfonamides as reported in U.S. Patent No. 5,633,272 to Talley *et al.*, including the compound 4-[5-methyl-3-phenylisoxazol-4-yl]benzenesulfonamide, also referred to herein as valdecoxib (III).

A need for formulated compositions of selective COX-2 inhibitory drugs, particularly rapid-onset compositions of such drugs, exists. Rapid-onset drug delivery systems can provide many benefits over conventional dosage forms. Generally, rapid-onset preparations provide a more immediate therapeutic effect than standard dosage forms. For example, in the treatment of acute pain, for example in headache or migraine, rapid-onset dosage forms are useful to provide fast pain relief.

10 Australian Patent Applications No. 200042711, No. 200043730 and No. 200043736 disclose compositions comprising a selective COX-2 inhibitory drug, a 5HT<sub>1</sub> receptor agonist and caffeine, said to be useful for treating migraine.

15 U.S. Patent No. 5,993,858 to Crison & Amidon discloses an excipient formulation for increasing bioavailability of a poorly water-soluble drug. The formulation is said to be self-microemulsifying and to comprise an oil or other lipid material, a surfactant and a hydrophilic co-surfactant. The choice of surfactant is said to be less critical than the choice of co-surfactant, which reportedly should have an HLB (hydrophilic-lipophilic balance) number greater than 8. A preferred example of 20 such a co-surfactant is said to be Labrasol<sup>TM</sup> of Gattefossé, identified as a product "comprised of medium-chain triglycerides derived from coconut oil" having HLB of 14. A formulation prepared containing 15 mg nifedipine in a size 1 (0.5 ml) capsule, *i.e.*, at a concentration of 30 mg/ml, is described as a "clear solution" at 70°C but a "semi-solid" at room temperature.

25 Cited in above-referenced U.S. Patent No. 5,993,858 is prior work by Farah *et al.* in which a self-microemulsifying formulation was investigated for improving *in vitro* dissolution of indomethacin. The formulation of Farah *et al.* reportedly comprised an oil phase material Gelucire<sup>TM</sup> of Gattefossé, together with a polyethylene glycol capric/caprylic glyceride product having HLB of 10, a propylene

glycol laurate product having HLB of 4, and diethylene glycol monoethyl ether.

Drugs of low water solubility are sometimes orally administered in suspension in an imbibable aqueous liquid. For example, a suspension of particulate celecoxib in a vehicle of apple juice is disclosed in co-assigned International Patent Publication 5 No. WO 00/32189, incorporated herein by reference. Also disclosed therein is a dilute solution of celecoxib in a mixture of PEG-400 (polyethylene glycol having an average molecular weight of about 400) and water in a 2:1 ratio by volume.

The suspension and solution compositions of WO 00/32189 are indicated therein to have comparable bioavailability. However, following oral administration to 10 dogs, the time taken for blood serum celecoxib concentration to reach a maximum level ( $T_{max}$ ) was shorter for the solution composition than for the suspension.

Above-cited U.S. Patent No. 5,760,068 discloses that its subject pyrazolyl benzenesulfonamide compounds, of which celecoxib and deracoxib are examples, can be administered parenterally as isotonic solutions in a range of solvents including 15 polyethylene glycol and propylene glycol. It is also disclosed therein that the subject compounds can alternatively be present in a controlled-release capsule or tablet formulation for oral administration wherein, for example, such a compound is dispersed in hydroxypropylmethylcellulose (HPMC).

Above-cited U.S. Patent No. 5,633,272 discloses that its subject isoxazolyl benzenesulfonamides, of which valdecoxib is an example, can be administered 20 parenterally as isotonic solutions in a range of solvents including polyethylene glycol and propylene glycol. It is also disclosed therein that the subject compounds can alternatively be present in a controlled-release capsule or tablet formulation for oral administration wherein, for example, such a compound is dispersed in HPMC.

25 It is known to encapsulate liquid formulations, for example in soft or hard gelatin capsules, to provide a discrete dosage form.

Many aminosulfonyl-comprising selective COX-2 inhibitory drugs, including celecoxib, deracoxib and valdecoxib, have low solubility in aqueous media. In addition, some, for example celecoxib, have relatively high dose requirements. These 30 properties present practical problems in formulating concentrated solutions of such drugs for rapid-onset, oral administration. With respect to high dose, low solubility drugs, the size of the capsule or volume of solution required to provide a therapeutic

ts (Journal of Electronic Imaging, vol. 2(4), 1993年10月)、Shu, J.による「Adaptive Filtering for Error Diffusion Quality Improvement」(SID Digest of Technical Papers, 1995年5月)、米国特許番号第5,737,453号、および第5,757,976号の文献に記述され、その全てを参照してここに取り込む。階調依存型誤差拡散技術は、典型的には単色である。

【0008】カラー画像を印刷する場合、複数の色（例えばシアン、マゼンタ、黄色）のドットがさまざまな組合せで印刷され、所望のカラー階調を達成し、オリジナルのカラー画像を再生する。既知の誤差拡散法の多くは、1度に1つの色平面（例えば、シアン、マゼンタまたは黄色）で動作する。このような種類の誤差拡散法は、それぞれの色のために、ドットの視覚的に心地よいパターン（離散したドット）を、他の色のドットのパターンとは無関係に生成しようとする。ランダム・チャンスに起因して、これらの重なっている色のドット・パターンは、図1に示すように、必然的に異なる色の2つ以上のドットが重なるか、または互いに隣接する結果となる。これは、人間の目ではドットの固まりとして認識される。

【0009】図1は、マゼンタ・ドット4およびシアン・ドット6を使用する従来技術の多色ドット・パターンの例を示す。全体的な階調はライト・ブルーである。シアンおよびマゼンタ平面が重なる場合、隣り合ったシアンおよびマゼンタ・ドット（例えば場所7で）に起因する心地の悪いドット・パターンがランダム・チャンスに起因して形成される。平面依存型として知られる他の既知の誤差拡散法は、複数の色平面で同時に動作する。そのような方法は、同じ出願人が所有する米国特許出願番号第08/880475号「Correlating Cyan and Magenta Planes for Error Diffusion Halftoning」（1997年6月3日）に記述され、その記述を参照してここに取り込む。複数の色平面（例えばシアンおよびマゼンタ）は、組合せの100%塗りつぶしまで、互いの上に打たれないドット・パターンを生成するように相互に関連付けられる。その結果、暗い「青」のドット（シアンとマゼンタの重なりは暗い青を生成する。）の発生が避けられる。この青ドットの発生は、粒状性（graininess）が知覚されることになる白スペースを塗る。このようにして、より視覚的に心地よいドットのパターン化が生成される。

【0010】図2は、平面依存型誤差拡散法を使用して印刷されるシアンおよびマゼンタ・ドットのドット・パターンの例を示す。隣接する又は重なるシアンおよびマゼンタ・ドットがないので、図2は、図1より改善されている。

【0011】しかしながら、図2に見られるように、平面依存型ハーフトーン法の欠点は、ドットの相対的な空

間配置が、明るい階調（light tone）で最適でないということである。この結果、明るい階調または中間調において、パターンが印刷出力において展開することができる。これらのパターンは、誤差が画像にわたって「カスクード」し、印刷ドットの曲線を生成する態様が原因で現れる。それらが画像内の小さな細い虫に似ているので、これらの異物を「虫（worm）」という。

#### 【0012】

【発明が解決しようとする課題】上に論じたように、階調依存型誤差拡散を使用して心地よいドットのパターンを生成することができる一方で、階調依存型誤差拡散は、単色である。この結果、カラー画像での階調依存型誤差拡散の使用は、各色が無関係に心地よいパターンを持ち、ランダムに重なる画像を生じる。

【0013】このため、色のランダムな重なりがなく、均一なパターンを生成するよう相互に関連づけた、複数の色の印刷出力を提供するカラーハーフトーン法に対する要求がある。

#### 【0014】

【課題を解決するための手段】この発明は、各画像ピクセルがあらかじめ決められた階調レベルをもつ画像ピクセルで構成される画像を処理するための方法およびシステムを提供する。この方法は、プリンタなどのデジタル出力装置に出力するためのイメージを処理するために階調依存かつ平面依存の誤差拡散ハーフトーンを使う。階調依存の平面誤差拡散ハーフトーンは、いずれかのカラー平面にドットの配置を決めるとき、シアンおよびマゼンタのような複数のカラー平面を考慮に入れる。相関しているカラー平面の組み合わせられた階調が、スレッシュ・ホールドレベルを判定するのに使われる。相関しているカラー平面についての組み合わせられた階調および累積誤差がしきい値レベルと比較される。さらに、階調依存の誤差重みは、相関しているカラー平面の組み合わせられた階調に基づいて決められる。階調依存の誤差重みが、それぞれカラー平面のために最終的な累積誤差を拡散するために使われる。より均一なパターンを提供するためドットの目立つ凝集を避け、カラーの意図しない重なりを避けるため、この手法を使って、2以上の色の印刷ドットが分散される。

【0015】この方法は、それぞれのピクセル位置にドットを印刷しないか、相関されているカラー平面の1ドットを印刷するか、または2つのドットを印刷するかを決める。（1）平面依存のカラーからの組み合わせられた階調がフル強度しきい値（100パーセントの塗りつぶし）より上にあるならば、すなわち、ピクセルがドットが印刷されなければならないことを示す階調値を有するならば、2つのドットが印刷される。また、（2）平面依存のカラーからの組み合わせられた階調および累積誤差が階調依存のしきい値より大きいならば、2つのドットが印刷される。印刷される2つのドットは、好ましくは、

同じカラーでない。(1)または(2)のいずれかが真であれば、1つのドットが印刷され、(1)または(2)のどちらも真でなければ、ドットは印刷されない。カラー平面が相關しているので、相關しているカラーのドットの印刷は、印刷ドットが意図せずに重なる可能性を低減する。

【0016】このように、誤差拡散は、ピクセルを表すためにゼロ個、1つ、または2つのドットを印刷するべきかどうか決めるときに、複数のカラー平面およびピクセルの階調レベルを考慮に入れる。この手法は、ほとんどの既存の誤差拡散方法を強化するために使うことができる。好ましい形態では、マゼンタおよびシアン・カラー平面の間の相關だけが実行され、黄色の平面による相關は実行されない。これは、シアンおよびマゼンタ平面が黄色より暗いからであり、隣接または重なっているシアンおよびマゼンタのドットは黄色のドットに隣接したシアンまたはマゼンタのドットより非常に目立つからである。しかし、少なくとも3つのカラー平面による相關も、ここで記述される手法を使って実行することができる。

#### 【0017】

【発明の実施の形態】図3は、ここで記述する誤差拡散法の一部またはすべてを実行する処理回路を備えるカラー・インクジェット・プリンタ10の1つの種類を示す。カラー・インクジェット・プリンタは、カバー11、紙トレイ12、用紙14、印刷されたページを受けて取る出力トレイ15、カラー印刷カートリッジ16、およびドットが紙に印刷される間にスライド棒20に沿ってスライドする走査カートリッジ18を備える。カラー印刷カートリッジ16は、シアン(C)、マゼンタ(M)、イエロー(Y)、黒(K)などの複数のインクを備える。

【0018】図4は、ホスト・コンピュータ22、CRTなどのモニタ23およびプリンタ24を備える印刷システムの模式図である。プリンタ24は、走査カートリッジ内の黒インク・ジェット印刷カートリッジ26、および、3色(CMY)インクジェット印刷カートリッジ25、又は多数色インクジェット印刷カートリッジを使用する種類のカラー・インクジェット・プリンタである。図3のプリンタ10はコンピュータ22に接続されてもよい。プリンタ24はプリンタ制御装置28を備え、印刷カートリッジ25および26によるドットの印刷を制御する。印刷カートリッジは、300ドット/インチ(DPI)、600DPI、又は任意の他の解像度で印刷することができる。

【0019】図5はコンピュータ22からプリンタ24までの画像情報の標準的な流れを図示する。最初に画像が、生成されるか、またはコンピュータ22のメモリに取り込まれる。コンピュータ・モニタ23に表示するために、この画像は加法RGB色空間で表される。スクリーンに位置する各ピクセルは、256段階の強度または

階調のいずれか1つ(0から255)で赤、緑、青に照明することができる。256段階( $2^8 = 256$ )を表すのに8ビットを要する。各3原色が8ビットを必要とするので、RGBカラー・モニタは、24ビット・カラー( $3 \times 8 = 24$ )を生成すると一般的にいわれる。この画像は特定のモニタの空間解像度で表現される。典型的なモニタは、水平および垂直方向において、一方の1インチ当たりに75個のピクセル(75DPI)を有する。

【0020】ステップ30で、24ビットRGBカラー画像は、モニタ23に表示することができるよう、コンピュータ22のメモリに格納される。

【0021】ステップ32で、メモリ内の画像を、プリンタの解像度での24ビットRGB画像に変換する。典型的インクジェット・プリンタは、1インチ当たりに300個、600個、または1200個のドットの解像度を有する。プリンタは、典型的にはCMYまたはCMYKの減色法で印刷するけれども、ステップ32の画像処理のため、プリンタをRGB装置と考えるのが都合良い。これは、カラー・モニタのRGB値をCMYに直接変換する後の処理により、通常、色光的な適合(colorimetric match)が生成されるからである。しかしながら、適合するすべての値が、同じ画像品質を生成するわけではない。ある選択は他よりも視覚的ノイズを多く含み、他の選択は、画像のハーフトーンの遷移に不所望な不連続性をもたらすことがある。

【0022】ステップ34でプリンタRGBカラー画像は、参照テーブルまたは他の簡単な変換方法を使用してCMY色空間に変換される。もちろん、同様の方法でカラー画像をCMYK色空間に変換することができる。

【0023】ステップ36で、CMY画像はハーフトーン化され、プリンタのDPI解像度で、1色につき8ビットの3平面(3-plane、ここではCMY)から、2値(オンまたはオフのドット)の色の3平面に変換される。言い換えれば、各ピクセル位置での色および階調(0から255)は、印刷すべきC、M、またはYのオン、オフのドットのパターン(0から255の強度)に変換される。このハーフトーン化された画像(全画像の一部であってもよい。)は、メモリに記憶される。ステップ36を後でより詳細に述べる。

【0024】ステップ38で、ハーフトーン画像は、効率のよい通信技術を一般に使用してプリンタに送信される。そのような例としては、ヒューレット・パッカード社のPrinter Control Language (PCL)として知られるようなエスケープ・シーケンスを使用する。ステップ36で生成された画像は、ドットの位置、およびそのページ上の各ピクセル位置で印刷すべき各色のドット数についてのすべての情報を含む。プリンタ・コントローラ28(図4)は、これらのドットが、例えば、1つのバス(pass)または複数のバスでいつ印刷されるべきかを

決める。インクジェット印刷の特性が原因で、複数のパスにドットを配置して、格子模様、またはまばらなパターンのようなものにおける個々のバスを印刷することが有利である。列の間で生じることのあるアーティファクト (artifact) を隠すために、これらのすきまのあるパターンとバスを一部重ねるのも有利である。どのバスにどのパターンでドットを置くかについての判断手順は、「印刷モード」といわれる。

【0025】ハーフトーン化ステップ36は、図を参照して詳細に述べられる。かくして、図5のステップ34が完了したとし、ここでハーフトーン化のステップが実行されなければならない。

【0026】プリンタに応じて、図5に関連して述べられる機能が、処理機能を実行するようにプログラムされたホスト・コンピュータまたはプリンタによって実行される。たとえば、「スマート (smart)」プリンタでは、ステップ32から38のすべてをプリンタで実行することができる。一方、プリンタのコストを節約するならば、機能32から38のすべてまたは一部は、ホスト・コンピュータで実行されてもよい。

【0027】ハーフトーン化のステップの前に、フルカラー画像に関して分離された画像表現が、印刷すべき各原色に関する平面に記憶されると考える。これは図6から図8に関して説明する。

【0028】図6はコンピュータ・モニタの解像度でのフルカラー画像における $3 \times 3$ のピクセルのブロック40を示す。各ピクセルはライト・ブルー (LB) として認識される色の強度を有する。以下では、1ピクセルにつき0から255の階調範囲が、すべての範囲の色強度を伝達すると考える。

【0029】図7および8は、図6と同じ $3 \times 3$ のピクセルのブロックを示しているが、これらは、全体としてライト・ブルーの強度を生成するのに、各ピクセル領域に必要なシアン階調 (図7) を44 (255のうち) として示し、マゼンタ階調 (図8) を33として示している。2平面におけるシアンとマゼンタの組合せは、最終的な所望の階調を生成する。シアンおよびマゼンタの階調は、領域内のドットの数に比例し、255の強度は、シアンまたはマゼンタのドットでその領域を完全に塗りつぶすものである。実際のオリジナルのピクセル位置あたりのドット数は、オリジナル画像の解像度 (ピクセル密度) およびプリンタの解像度 (1インチあたりのドット数) に依存する。

【0030】誤差拡散は、ハードコピー出力装置が印刷するもの (例えば0又は255階調のシアン・ドット) と実際の画像のピクセル階調 (例えば44のシアン階調) のとの差を、可能なドット位置を表現する各点について識別しようとする。そのような誤差がないときは、画像のピクセル階調がまさにドットを印刷すべき255、またはドットを印刷すべきではない0である場合だ

けである。しかしながら、そのような状況はまれである。したがって、通常は誤差が存在する。もし、ドットが印刷されて、階調レベルが255以下なら、誤差は正になる (すなわち、画像ピクセルによって実際に要求されたものより大きい階調レベルが印刷された)。もしドットが印刷されず、画像のピクセル階調が0より大きいならば、誤差は負になる (すなわち、画像ピクセルによって要求されたものより小さい階調レベルが印刷された)。誤差拡散は近隣のピクセルにこの誤差を拡散する。

【0031】下の例では、再現すべき図6のライト・ブルー階調が、シアンおよびマゼンタのドットの組合せを必要とすると考える。シアンおよびマゼンタの階調は図7および図8に示される。別の階調は、シアンおよびマゼンタのドットに組合せて、黄色及び黒の使用も必要とする。

【0032】この方法は、処理される各ピクセルのために、シアンおよびマゼンタの両方を印刷することを可能とする。前に印刷したシアン・ドットからの累積誤差に基づいて、シアン・ドットを印刷するかどうかを判定する標準的誤差拡散技術の代わりに、好みの実施形態の誤差拡散法は、前のシアンおよびマゼンタのドットの組合せ誤差に基づいて、ドットを印刷しないか、シアン又はマゼンタのどちらか1つのドットを印刷すべきか、またはシアンおよびマゼンタの両方から成る2つのドットを印刷すべきかを判断する。本発明の方法は、各ピクセルの色の階調レベルに基づいて最適なしきい値および誤差の重みを決定するステップを含む。1つの実施形態においては、あらかじめ中間調に表現されたピットマップは、中間調で発生しうる顕著な構造的パターンを避けるために使用される。使用した場合、あらかじめ中間調表現されたピットマップは、下でさらに詳細に述べる階調依存のしきい値にリンクされる。

【0033】最適の階調依存型誤差拡散しきい値、および誤差の重みは、異なるバラメータの範囲にわたる各階調のための、バッチのセットを印刷し、最も視覚的に心地よく見えるバッチおよびバラメータを選択することによって、人力で決められる。階調依存しきい値、および誤差の重みを生成する他の方法は、希望に応じて利用することができる。

【0034】本発明は、階調依存および平面依存の組合せを使用して、ドットを印刷しない、1つのドットを印刷する、各ピクセルに2つのドットを印刷する。2つのドットは、(1) 平面依存色からの組合せ階調が、フル強度しきい値、すなわち100%塗りつぶしきい値を超えるならば印刷される。また、2つのドットは、(2) 平面依存色からの組合せ階調および累積誤差が、階調依存しきい値より大きいときに印刷される。印刷された2つのドットは、同じ色ではないことが好みしい。したがって、例えば、シアン・ドットが印刷され、続い

てマゼンタ・ドットが印刷され（または逆）、暗い青のドットが生成される。（1）または（2）のどちらかが真である場合、1つのドットが印刷され、（1）も（2）も真ではない場合、ドットは印刷されない。階調依存誤差の重みを使用して、平面依存の色の累積誤差が分散される。

【0035】本発明の1つの実施形態による、階調依存平面依存型誤差拡散ハーフトーン法の基本ステップを示すフローチャートを、図9および図10に示す。

【0036】図9に示すように、ステップ34から変換されたCMY画像は、ステップ50、51、および52によって受け取られる。ステップ50、51、52において、異なる色の階調レベルが、処理される特定のピクセルのために識別される。例とえば、シアン、マゼンタ、および黄色の階調が求められる。ステップ50からステップ52は、従来の技術を使用して並列に実行されてもよい。例えば、処理されるピクセルの8ビットRGB強度は、参照テーブル、または他の従来技術の手段を使用して、CMY色平面についての0から255の階調レベルに相互参照されてもよい。CMY階調を求めるステップは、図5のステップ34の部分で実行される。

【0037】ステップ50から52と並列に実行されることができるステップ54において、依存する色平面の色調レベルが合計される。このように、シアンおよびマゼンタ平面が依存型である場合、シアンおよびマゼンタ色調レベルの入力合計（ $c+m$ ）が生成される。それぞれが0から255にわたる個々のcおよびmの色調を加えることによって入力合計（ $c+m$ ）が得られるので、入力合計（ $c+m$ ）の範囲は、0から510である。

【0038】ステップ56で、処理されているピクセルのための入力加算（ $c+m$ ）が100パーセントの塗りつぶしきい値、すなわち、いっぱいの強度しきい値である255より小さいかどうかが判定される。ピクセルが255以上の階調値を有するとき、ドットがそのピクセルのために印刷され、ピクセルは100パーセントフルである。このように、入力加算（ $c+m$ ）がいっぱいの強度しきい値（255）以上であるならば、平面依存のカラーのうちの1つのドットを印刷する決定がなされ、プロセスはステップ58に移る。

【0039】ステップ58で、シアンおよびマゼンタのために現在トータル値を比較することによって、シアン・ドットかマゼンタ・ドットが印刷されなければならないかどうか、判定される。ここでは、カラーのための現在のトータル値は、階調レベルおよび処理されているピクセルでのそのカラーについての全ての累積誤差の和であるとする。ceおよびmeが、以前に処理されたピクセルからのシアンおよびマゼンタのためのそれぞれの累積誤差であるとして、シアンのための現在のトータル値（ $c+e$ ）がマゼンタのために現在のトータル値（ $m+e$ ）以上であるならば、シアン・ドットがステップ60で印刷され

る。誤差は、しかしこの点で分散されない。その代わりに、シアン・ドットがステップ60で印刷されるので、前の累積誤差（ce）マイナス255に等しい修正累積誤差（ce'）が生成される。マゼンタ・ドットがステップ60で印刷されなかったので、マゼンタのための修正された累積誤差（me'）は、前の累積誤差（me）と同じである。発射フラグが1に等しく設定され、第1ドットがそのピクセルのために印刷されたことを示す。

【0040】他方、シアンのためのトータル値（c+ce）がマゼンタのためのトータル値（m+me）より小さいならば、マゼンタ・ドットがステップ62で印刷される。マゼンタ・ドットがステップ62で発射されるので、修正された累積誤差（me'）は、マゼンタについて前の累積誤差（me）マイナス255に等しく生成される。シアン・ドットがステップ62で印刷されなかったので、シアンのための修正された累積誤差（ce'）は、前の累積誤差（ce）と等しい。再び、発射フラグは、ドットが印刷されたことを示す1に等しく設定される。

【0041】シアン・ドットがステップ60で印刷された、あるいは、マゼンタ・ドットがステップ62で印刷されたかどうかに関係なく、処理はそれから図10におけるステップ64に移る。

【0042】ステップ56で、入力加算（ $c+m$ ）が100パーセントの塗りつぶしきい値（255）より小さいならば、プロセスにおけるこの点でドットを印刷しない決定がなされる。ドットが発射されなかったので、ステップ57で、発射フラグが0にセットされ、マゼンタおよびシアンのための修正された累積誤差（me'）、（ce'）は、マゼンタおよびシアンについて前に累算された誤差（me）、（ce）に等しい。処理は、それから図10におけるステップ64に移る。

【0043】図10で示すように、修正された入力加算（ $m+c$ ）'がステップ64で生成される。修正された入力加算（ $m+c$ ）'は、オリジナルの入力加算（ $m+c$ ）から発射フラグおよび255を引いた値に等しい。このように、シアンかマゼンタがステップ60または62で印刷されるならば、発射フラグは1で、修正された入力加算（ $m+c$ ）'は、オリジナルの入力加算（ $m+c$ ）マイナス255に等しく、さもなければ修正された入力加算（ $m+c$ ）'は、オリジナルの入力加算（ $m+c$ ）と等しい。従って、ドットがすでに印刷されたかどうかに関係なく、修正された入力加算（ $m+c$ ）'は0から255にわたる。

【0044】修正された入力加算（ $m+c$ ）'は、ステップ64における階調依存のルック・アップ・テーブルから5つの値を集めるために使われる。階調依存のルック・アップ・テーブルは、階調依存のしきい値レベルおよび4つの階調依存の誤差重み（W1、W2、W3およびW4）を提供し、それらが更に詳細に下で記述される誤差分散に使われることになる。

【0045】発射フラグが1と等しいならば、すなわち

シアンかマゼンタ・ドットがステップ60または62で印刷されたならば、ステップ66でしきい値レベルが修正され、そのピクセルのために別のドットを印刷するのを難しくする。しきい値レベルは、しきい値レベルを経験的に決められるあらかじめ決められた数（例えば80）増やすことによって修正される。もちろん、希望する場合、しきい値レベルは修正される必要がなく、あるいは、他のあらかじめ決められた量または変数量によって修正されてもよい。この変数量は、修正された入力加算( $m+c$ )のサイズや累積誤差 $ce'$ および $me'$ のサイズのようなファクターその他の有用なファクターに依存する。

【0046】平面依存のカラーであるシアンおよびマゼンタの階調レベルおよび修正された累積誤差は、加算されてステップ68で修正されたトータル値加算( $c+ce'+m+me'$ )を生成する。ステップ70で、修正されたトータル値加算( $c+ce'+m+me'$ )は、階調依存するしきい値レベルと比較される。修正されたトータル値加算( $c+ce'+m+me'$ )がしきい値レベルより小さいならば、ドットはこのプロセス時点で印刷されないで、プロセスはステップ72における誤差拡散に移る。しかし、修正されたトータル値加算( $c+ce'+m+me'$ )がしきい値レベルより大きいならば、ドットを印刷する決定がなされ、プロセスはステップ76に移る。

【0047】ステップ76で、シアン( $c+ce'$ )（それはシアンの階調レベルにシアンについての修正された累積誤差を加えたものである）の修正されたトータル値が、マゼンタのための階調レベルにマゼンタについての修正された累積誤差を加えたものである、マゼンタ( $m+me'$ )についての修正されたトータル値と比較される。シアン( $c+ce'$ )についての修正されたトータル値がマゼンタ( $m+me'$ )についての修正されたトータル値以上であるならば、シアン・ドットがステップ78で印刷され、さもなければ、マゼンタ・ドットがステップ80で印刷される。ステップ78で示すように、シアン・ドットが印刷されるので、シアン累積誤差が再び修正されて、シアンのために最終的な分散誤差( $ce''$ )を生成し、それは、前の修正された累積誤差( $ce'$ )プラス、シアンの入力階調( $c$ )マイナス255に等しい。マゼンタのための最終的な分散誤差( $me''$ )は、前の修正された累積誤差( $m+e'$ )プラス、マゼンタのための入力階調( $m$ )と等しい。ステップ80でマゼンタ・ドットが印刷されるので、マゼンタのための最終的な分散誤差( $me''$ )は、前の修正されたマゼンタ誤差( $me'$ )プラス入力階調( $m$ )マイナス255に等しく生成され、一方、シアンのための最終的な分散誤差( $ce''$ )は、前の修正された誤差( $ce'$ )プラス入力階調( $c$ )に等しい。プロセスは、それからステップ72で最終的な分散誤差を拡散する。

【0048】このように、ドットを印刷する決定は、平面依存するカラーの階調レベルが100パーセントの塗りつぶししきい値より上にあるかどうかに基づいてステッ

プ56でなされる。どちらかのカラー・ドットが印刷されたかどうかに基づいて、平面依存するカラーの階調の加算を適切に修正した後に、階調依存するしきい値レベルが、修正された入力加算に基づいて判定される。ドットを印刷する別の決定は、平面依存するカラーの階調レベル、プラスそれらの累積誤差が、階調依存するしきい値より大きいかどうかに基づいてステップ70でなされる。このように、ステップ56および70は、ドットを生成しないか、1つのドットまたは2つのドットを生成するかを決めることができる。

【0049】2つのドットが印刷されるとしても、ステップ60または62でマゼンタおよびシアンについての累積誤差が修正されているので、同じカラーが二回印刷されることはない。こうして、マゼンタ・ドットがステップ62で印刷され、続いてステップ78でシアン・ドットが印刷されるか、またはステップ80でマゼンタ・ドットが印刷される。2つのシアン・ドットまたは2つのマゼンタ・ドットがこの実施例で印刷されることはない。重なるシアン・ドットおよびマゼンタ・ドットは、ダークブルーのドットを生成し、それは特定のピクセルでの強度が高いときは適切でありうる。2つのドットが重なるとして記述しているが、プリント・カートリッジの連続的なスキヤンに起因してドットは、完全に重ならないことがあると思われなければならない。

【0050】ステップ70で、修正されたトータル値加算( $c+ce'+m+me'$ )がしきい値レベルより小さいならば、ドットはプロセスのこの時点で印刷されない。このように、ピクセルは、ドットなしで表されるか、または1つのドットがステップ60または62で印刷されたならば、すなわち、ピクセルが100パーセント一杯であるならば、1つのドットだけで表される。ドットが印刷されなかったので、ステップ81で、シアン( $ce''$ )およびマゼンタ( $me''$ )についての最終的な分散誤差の値は、修正された累積誤差プラスシアン( $ce'+c$ )およびマゼンタ( $me'+m$ )についての入力階調に等しいと定義される。プロセスは、ついでステップ72に移る。

【0051】ステップ72において、ステップ78、80または81からのシアンについての最終的な分散誤差( $ce''$ )およびマゼンタについての最終的な分散誤差( $me''$ )に、ステップ64で判定した階調依存の誤差重み $W1$ 、 $W2$ 、 $W3$ および $W4$ の値がかけられる。シアンおよびマゼンタについて重みをつけられた誤差は、図11で示すように近くのピクセルに拡散される。

【0052】この発明の1つの実施例に従って、図11で示すように、4項誤差拡散が、使われる。このように、処理されている現在のピクセル（例えばピクセル94）に由来する最終的な分散誤差は、次の水平ピクセル95および次の行のピクセル、すなわちピクセル96、97および98に拡散される。これらの隣接したピクセルのそれぞれ拡散される誤差の約合いは、階調依存する誤差重み $W1$ 、 $W$

2、W3およびW4を使って判定される。0、1つ、または2つのドットが次のピクセル・ポジション95から98に印刷されることの決定は、これらのピクセルについての所望の階調レベルおよびピクセル94からの分散誤差ならびに他のピクセルからの累算分散誤差に基づく。

【0053】好ましい実施例において、画像のそれぞれの行が処理されたあと、処理の方向が反転され、誤差拡散手法は、蛇行処理システムを使用する。従って、処理の方向が逆にされるとき、図1 1の鏡像が使われる。希望する場合、2バス方式の蛇行処理システムまたは非蛇行処理システムを使うこともできる。

【0054】黄色のドットを印刷するための決定は、シアンおよびマゼンタ・ドットを印刷するためのステップと平行に実行することができる。シアンおよびマゼンタ・ドットが黄色のドットより暗いので、黄色の平面をシアンおよびマゼンタ平面に関連させることはほとんど便宜を提供しない。黄色のドットを印刷するための決定は、図1 1に関して記述される誤差拡散手法を使い、図9

```

m = マゼンタのための現在の入力値
c = シアンのための現在の入力値
c_total = c + シアンのための累積誤差;
m_total = m + マゼンタのための累積誤差;
Input_sum = m + c;
Fired = 0;
if (Input_sum >= 255.0) { //和とチェックし、255より大きければなに
    かを発射しなさい!
    Fired = 1;
    if(m_total > c_total)
    {
        マゼンタ・ドットを発射しなさい
        m_total = m_total-255
    }
    else
    {
        シアン・ドットを発射しなさい
        c_total = c_total-255;
    }
} // end sum>= 255
//この時点で1ドット発射しているかもしれない
Input_sum=Input_sum-(FIRE*255); //1ドット発射していれば、和を修正し
なさい
Threshold_level = t[Input_sum] [0]; //階調依存のテーブルを使いなさ
い
Weight1 = t[Input_sum] [1];
Weight2 = t[Input_sum] [2];
Weight3 = t[Input_sum] [3];
Weight4 = t[Input_sum] [4];
if (fired) //すでに発射していれば、再発射を困難にしなさい
{
    Threshold_level = Threshold_level+80;
}

```

でステップ84、86、88、90および92として示されるステップを含む。

【0055】黒いドットがシアンまたはマゼンタのドットと異なるサイズである場合、ブラックは同様にシアンおよびマゼンタとは別にハーフトーンされることができる。修正された入力加算( $m+c'$ )を黄色または黒の平面の単一値で置換することによって、ステップ64で使われる同じ階調依存のテーブルを、黄色の平面(ステージ84で)または黒い平面において独立に使うことができる。所望であるならば、図9および10において記述した方法をスケールすることによって、たとえばシアン・ドットおよびマゼンタ・ドットと同じサイズの黒ドットを使う製品において、黄色の平面や黒い平面をシアンおよびマゼンタ平面に関連させることができる。

【0056】擬似コードで示すと、階調依存の平面に依存する誤差拡散ハーフトーン方法は、次の表に示す通りである：

【表1】

```

}
fired = 0;
modified_sum=c_total+m_total
if (Threshold level<; Modified_sum//どの平面が最も高い値を有するかチェックし、それを発射しなさい
{
  if(m_total >; c_total)
    マゼンタを発射しなさい;
  Else
    シアンを発射しなさい;
}
マゼンタのための誤差を計算しW1、W2、W3、W4を使って分散させる
シアンのための誤差を計算しW1、W2、W3、W4を使って分散させる

```

【0057】上記の誤差拡散処理を使うことは、平面依存度を階調依存度と組み合わせて、優れたドット配置および均一なバターニングをもつ画像を生成するカラー・誤差拡散ハーフトーン方法を創りだす。

【0058】この発明の別の実施例において、平面依存する階調依存の誤差拡散ハーフトーン法は、ミッド・トーン（すなわちおよそ50パーセントの階調）について予めレンダリングされたビットマップを使用することを含む。誤差拡散は、時々画像にミッド・トーンで組み立てられたパターンを生成する。予めレンダリングされた50パーセントのビットマップが、ミッド・トーンにおける視覚アーチファクトをバラバラにするために使われる。

【0059】予めレンダリングされた50パーセントのビットマップを使用するために、誤差拡散処理は、修正されたトータル値加算 ( $c+ce'+m+me'$ ) がミッド・トーン範囲に入るかどうか判定し、入るならば、ドットを印刷するべきかどうか決めるためにビットマップが使用される。ピクセルの位置はビットマップと比較され、ビットマップが1の値を有するならば、ドットが印刷され、さもなければ、ドットは印刷されない。修正されたトータル値加算 ( $c+ce'+m+me'$ ) がミッド・トーン範囲より大きいならば、ドットが印刷され、修正されたトータル値加算 ( $c+ce'+m+me'$ ) がミッド・トーン範囲より小さいならば、ドットは印刷されない。

【0060】予めレンダリングされた50パーセントのビットマップの使用による平面依存型階調依存の誤差拡散処理が、図12に示される。図12は図9に続き、図10に似ており、同じ指定のステップは同じステップである。

【0061】図12で示すように、修正された入力加算 ( $m+c$ )' は、図10に示されるステップ64と同じ様でステップ65で生成される。修正された入力加算 ( $m+c$ )' は、ついで階調依存のルック・アップ・テーブルから6つの値を集めるために使われる。階調依存のルック・アップ・テーブルは、2つのしきい値レベル、すなわち低しきい値 (threshold\_low) および高しきい値 (threshold\_high)、ならびに4つの誤差重み (W1、W2、W3およびW4) を提供する。

【0062】階調依存のしきい値ルック・アップ・テーブルの例は、参考資料Aに示されており、階調レベルが「グレー」レベルで、上のしきい値が「 $t_u$ 」で、下のしきい値が「 $t_l$ 」である。

【0063】参考資料Aの階調依存のしきい値ルック・アップ・テーブルは、図10に関して説明したように、例えば、上のしきい値、下のしきい値のいずれかまたは上下のしきい値の平均を使うことによって、一つのしきい値レベルを提供するためには使うことができる。

【0064】階調依存の誤差重みルック・アップ・テーブルは、参考資料Bに示されており、階調レベルは「グレー」レベルであり、 $w[0, 1]$  が図11におけるピクセル95を表し、 $w[1-1]$  が図11におけるピクセル98を表し、 $w[1, 0]$  が図11におけるピクセル97を表し、 $w[1, 1]$  が図11におけるピクセル96を表す。付録Aの階調依存のしきい値ルック・アップ・テーブルおよび付録Bの階調依存の誤差重みテーブルが結合されて1つのテーブルになつていてもよいことはもちろんである。

【0065】ステップ67で、発射フラグが1に等しいならば、図10で示されるステップ66と同様に、低および高しきい値レベルが修正される。

【0066】修正されたトータル値加算 ( $c+ce'+m+me'$ ) がステップ68およびステップ71で生成され、修正されたトータル値加算 ( $c+ce'+m+me'$ ) が低しきい値と比較される。修正されたトータル値加算 ( $c+ce'+m+me'$ ) が低しきい値より小さいならば、ドットは印刷されず、プロセスはステップ81を通してステップ72における誤差拡散に移る。しかし、修正されたトータル値加算 ( $c+ce'+m+me'$ ) が低しきい値より大きいならば、修正されたトータル値加算 ( $c+ce'+m+me'$ ) は、ステップ74で高しきい値と比較される。修正されたトータル値加算 ( $c+ce'+m+me'$ ) が高しきい値より大きいならば、プロセスはステップ76へ行く。このステップは図10に関して上述した。

【0067】ステップ74で、修正されたトータル値加算 ( $c+ce'+m+me'$ ) が高しきい値より大きくなり、したがって、修正されたトータル値加算 ( $c+ce'+m+me'$ ) がミ

ッド・トーン範囲、すなわち低しきい値および高しきい値の間にあるならば、ステップ82は、ドットが印刷されるべきかどうかを判断するために予めレンダリングされたミッド・トーン・ビットマップを使う。ビットマップがピクセル場所で1の値を有するならば、ドットが印刷され、シアンまたはマゼンタのドットを印刷するかどうかを判断するためにステップ76が使われる。他方、ピクセル場所でビットマップの値が0であるならば、ドットは印刷されず、プロセスはステップ72に移る。

【0068】有用な予めレンダリングされたミッド・トーン・ビットマップの印刷画像が図13に示される。図13のビットマップは、当業者に周知の直接バイナリ・サーチ方式を使って生成された。図13で示されるビットマップは、印刷中の全ての画像をカバーするためにタイルのように並べてもよい。もちろん、希望する場合、図13で示されるもの以外の予めレンダリングされたミッド・トーン・ビットマップを使うこともできる。さら

```

m=マゼンタの現在の入力値
c=シアンの現在の入力値
c_total= c +シアンの累積誤差;
m_total= m +マゼンタの累積誤差;
Input_sum = m + c
Fired = 0 ;
if (Input_sum >= 255.0) { //和をチェックし、255を超えているなら何かを
    発射しなさい !
    Fired = 1 ;
    if(m_total > c_total)
    {
        マゼンタ・ドットを発射しなさい
        m_total = m_total -255 ;
    }
    else
    {
        シアン・ドットを発射しなさい
        c_total = c_total - 255 ;
    }
} // end sum> 255
//この時点で1ドットを発射しているかもしれない
Input_sum=Input_sum - (FIRED*255) ; //1ドットを発射していれば、加算を
修正しなさい
Threshold_low = t[Input_sum] [ 0 ] ; //階調依存のテーブルを使いなさい
Threshold_high = t[Input_sum] [ 1 ]
Weight1 = t[Input_sum] [ 2 ] ;
Weight2 = t[Input_sum] [ 3 ] ;
Weight3 = t[Input_sum] [ 4 ] ;
Weight4 = t[Input_sum] [ 5 ] ;
if (fired) //すでに発射していれば、再び発射するのを困難にしなさい
{
}

```

に、希望する場合、しきい値のあらかじめ決められたマトリックスを使うスクリーニング・プロセスを、予めレンダリングされたミッド・トーン・ビットマップの代わりに使うことができる。スクリーニングは、当業者に周知である。

【0069】このように、ステップ71および74は、修正されたトータル値加算( $c+ce'+m+me'$ )がミッド・トーン範囲内、すなわち、低および高しきい値の間になるか、またはその範囲の上または下になるか、を判定する。図12は、このプロセスが2つのステップ、すなわちステップ71および74で生じていることを示すが、この判定は、1つのステップでされてもよく、どんな順序でされてもよい。

【0070】擬似コードで示すと、上記のプロセスは、次の表の通りである：

【表2】

```

    Threshold_low = Threshold_low+80;
    Threshold_high = Threshold_high+80;
}
fired = 0;
modified_sum= c_total+m_total;
if(Threshold_low< Modified_sum < Threshold_high) //ビットマップを使
いなさい
{
    if (mid_tone_bitmap [at current location] = 1 )
        fired =1;
    }
    else if (sum > T1)
        fired =1 ;
    if(fired) //どの平面が最も高い値を有するかチェックし、それを発射しな
さい
    {
        if(m_total > c_total)
            マゼンタを発射しなさい;
        Else
            シアンを発射しなさい;
    }
マゼンタについて誤差を計算し、W1、W2、W3、W4を使って分散する
シアンについて誤差を計算し、W1、W2、W3、W4を使って分散する

```

【0071】この発明をシアン、マゼンタおよび黄色を参照して説明したが、この発明はどんな数のカラーのインクでも使うことができる。このように、再生されるべき階調は、媒体シアンおよび媒体マゼンタに加えて、例えば軽いシアン、軽いマゼンタ、暗いシアンおよび暗いマゼンタのような付加的な平面の結合によって創ることができる。プリンタのなかにはカラー平面シアン、マゼンタ、黄色、オレンジ、緑および黒を使うものがある。この発明は、これらの平面の全ての組み合わせに適用することができ、一群のカラー内で隣接したドットが印刷される可能性を減らし、構成されたパターンを除去するのを助けることができる。

【0072】好ましい実施例において、ルック・アップ・テーブルおよび誤差拡散処理を制御する方法は、コンピュータ読み取り可能な媒体、例えばマイクロディスクettまたはフロッピー（登録商標）ディスクett上にプリンタ・ドライバとして提供される。このプリンタ・ドライバは、ついで、図4のコンピュータ22のようなコンピュータにインストールされ、プログラムがコンピュータのRAMにインストールされる。そのようなプログラムは、また、プリンタにもインストールされ、1つの実施例ではプリンタ内のファームウェアにインストールされる。このプログラムは、プリントモード、プリントヘッド・パラメーターその他のファクターに依存するであろう。全ての論理関数は、ハードウェアまたはソフトウェアにおいて実行することができる。ハードウェアが使われるならば、種々のテーブル値は、ハーフトーン方法

を実施する回路にバスラインを通して利用可能だろう。この方法は、また、ASICによって実行されることがで、ASICは、種々の論理装置およびルック・アップ・テーブルへのデータのタイミングおよび転送を制御し、画像マップとの間の転送も制御する。このことは、この明細書を読む当業者にはよく理解されるであろう。

【0073】図14は、この発明に従ってシアン・ドット6およびマゼンタ・ドット4の組み合わせを使って印刷されたライトブルーの階調の例であり、平面依存度および階調依存パラメーターの優先ドット配置の利益が得られる。

【0074】好ましい実施例は、エキストラのルック・アップ・テーブルおよびさらにいくつかのオペレーションを必要とし、以前のハーフトーン方法より計算的にわずかに複雑になっているが、全体的なパフォーマンスは、ハーフトーンのための他の誤差拡散法よりわずかに遅いだけである。優れたドット分布の利益は、付加的な複雑さに値する。

【0075】この発明を具体的な実施形態を例にとって説明したが、この発明は、このような実施形態に限定されるものではない。この発明は、例として次の実施形態を含む。

【0076】1. カラー画像を印刷するための誤差拡散ハーフトーン法であって、カラー画像におけるピクセルで複数のカラーの階調を識別するステップ（50-52）と、入力加算を生成するために複数のカラーの階調を組み合わせるステップ（54）と、しきい値レベルを判定す

るために入力加算を使うステップ(64)と、トータル値加算を生成するために複数のカラーの階調をピクセルで複数のカラーの累積誤差と組み合わせるステップ(68)と、複数のカラーのうちの1つのドットを印刷すべきかどうか判定するためにトータル値加算をしきい値レベルと比較するステップ(70)と、を含むハーフトーン法。

【0077】2. さらにトータル値加算がしきい値レベルより大きいとき、どのカラードットを印刷すべきか判断するステップを含み、該判断するステップは、第1トータル値を生成するために第1カラーの階調を第1カラーの累積誤差と合計するステップと、第2トータル値を生成するために第2カラーの階調を第2カラーの累積誤差と合計するステップと、より大きいトータル値をもつカラーを判断するために第1トータル値を第2トータル値と比較するステップ(76)と、より大きいトータル値でカラーのドットを印刷するステップ(78および80)と、を含む上記1に記載の方法。

【0078】3. 少なくとも2つの誤差重みを判定するために入力加算を使うステップ(64)と、それぞれのカラーおよびあるならば印刷されたドットのカラーについての累積誤差に基づいて、それぞれカラーのために最終的な分散誤差を生成するステップ(78および80)と、それぞれのカラーについての最終的な分散誤差を拡散するために少なくとも2つの誤差重みを使うステップ(72)と、を含む上記2に記載の方法。

【0079】4. カラーの複数のうちの1つの第1ドットを印刷すべきかどうか判定するために入力加算をピクセルのフル強度しきい値と比較するステップ(56)を含む上記1に記載の方法。

【0080】5. 入力加算がフル強度しきい値より大きいとき、複数のカラーのうちの1つの第1ドットが印刷され、トータル値加算をしきい値レベルと比較することが、複数のカラーうちの1つの第2ドットを印刷すべきかどうか判定する上記4に記載の方法。

【0081】6. 入力加算がフル強度しきい値より大きいとき、どのカラーの第1ドットを印刷するかを判定するステップを含み、該判定するステップは、第1トータル値を生成するために第1カラーの階調を第1カラーのための累積誤差と合計するステップと、第2トータル値を生成するために第2カラーの階調を第2カラーの累積誤差と合計するステップと、より大きいトータル値をもつカラーを判断するために第1トータル値を第2トータル値と比較するステップ(58)と、より大きいトータル値でカラーの第1ドットを印刷するステップ(60、62)と、を含む上記5に記載の方法。

【0082】7. 修正された入力加算を生成するためにフル強度しきい値を入力加算から減ずることによって入力加算を修正するステップ(64)と、修正された入力加算が、しきい値レベルを判定するために使用され；それ

ぞのカラーおよびもあるならば印刷された第1ドットのカラーの累積誤差に基づいて、それぞれのカラーについて修正された累積誤差値を生成するステップ(60、62)と、を含み、トータル値加算を生成するために複数のカラーの階調が複数のカラーの修正された累積誤差と組み合わせられる(68)、上記6に記載の方法。

【0083】8. 第1ドットが複数のカラーのうちの1つの印刷され、第2ドットが複数のカラーの別の一つの印刷され、第1ドットおよび第2ドットが少なくとも部分的に重なって印刷される上記5に記載の方法。

【0084】9. トータル値加算がしきい値レベルより大きいとき、何色の第2ドットを印刷するかを判定することを含み、この判定ステップは、第1修正されたトータル値を生成するため第1カラーの階調を第1カラーについての修正された累積誤差と合計するステップと、第2修正されたトータル値を生成するために第2カラーの階調を第2カラーについての修正された累積誤差と合計するステップと、より大きいトータル値をもつカラーを判定するため、第1の修正されたトータル値を第2の修正されたトータル値と比較するステップ(76)と、より大きいトータル値をもつカラーの第2のものを印刷するステップ(78、80)とを含む、上記7に記載の方法。

【0085】10. 少なくとも2つの誤差重みを判定するために修正された入力加算を使うステップ(64)と、修正された累積誤差およびそれぞれのカラーについての入力階調および印刷された第2ドットのカラーに基づいてそれぞれのカラーの最終的な分散誤差を生成するステップ(80、78)と、それぞれカラーについての最終的な分散誤差を拡散するために少なくとも2つの誤差重みを使うステップ(72)とを含む上記9に記載の方法。

**THIS PAGE BLANK (USPTO)**

free-radical scavenging antioxidant in a composition of the invention greatly improves chemical stability of the drug. This finding is quite different from above-described situations where antioxidants have previously been used to prevent drug degradation. Without being bound by theory, it is believed that a free radical-scavenging antioxidant inhibits, slows or delays polyethylene glycol degradation, thereby limiting or inhibiting chemical interaction between polyethylene glycol degradation products and the drug.

5 Therefore, a composition of the present invention comprises at least one pharmaceutically acceptable free radical-scavenging antioxidant. A free radical-scavenging antioxidant is to be contrasted with a “non-free radical-scavenging antioxidant”, *i.e.*, an antioxidant that does not possess free radical-scavenging properties. Non-limiting illustrative examples of suitable free radical-scavenging antioxidants include  $\alpha$ -tocopherol (vitamin E), ascorbic acid (vitamin C) and salts thereof including sodium ascorbate and ascorbic acid palmitate, butylated hydroxyanisole (BHA), butylated hydroxytoluene (BHT), fumaric acid and salts thereof, hypophosphorous acid, malic acid, alkyl gallates, for example propyl gallate, octyl gallate and lauryl gallate, sodium thiosulfate, sodium sulfite, sodium bisulfite and sodium metabisulfite. Preferred free radical-scavenging antioxidants are alkyl gallates, vitamin E, BHA and BHT. More preferably the at least one free radical-scavenging antioxidant is propyl gallate.

10

15

20

One or more free radical-scavenging antioxidants are present in compositions of the invention in a total amount effective to substantially reduce formation of an addition compound, typically in a total amount of about 0.01% to about 5%, preferably about 0.01% to about 2.5%, and more preferably about 0.01% to about 1%, by weight of the composition.

25

Other excipients

Compositions of the invention optionally contain pharmaceutically acceptable excipients other than polyethylene glycol and free radical-scavenging antioxidants. In the case of a solution composition, for example, such excipients can include co-solvents, sweeteners, crystallization inhibitors, preservatives, dispersants, emulsifying agents, *etc.* Through selection and combination of excipients, compositions can be provided exhibiting improved performance with respect to drug concentration,

dissolution, dispersion, emulsification, efficacy, flavor, patient compliance and other properties.

A composition, particularly a solution composition, of the invention optionally comprises one or more pharmaceutically acceptable co-solvents. Non-limiting

5 examples of suitable co-solvents include additional glycols, alcohols, for example ethanol and n-butanol; oleic and linoleic acid triglycerides, for example soybean oil; caprylic/capric triglycerides, for example Miglyol™ 812 of Huls; caprylic/capric mono- and diglycerides, for example Capmul™ MCM of Abitec; polyoxyethylene caprylic/capric glycerides such as polyoxyethylene (8) caprylic/capric mono- and 10 diglycerides, for example Labrasol™ of Gattefossé; propylene glycol fatty acid esters, for example propylene glycol laurate; polyoxyethylene (35) castor oil, for example Cremophor™ EL of BASF; polyoxyethylene glyceryl trioleate, for example Tagat™ TO of Goldschmidt; lower alkyl esters of fatty acids, for example ethyl butyrate, ethyl caprylate and ethyl oleate; and water.

15 A composition, particularly a solution composition, of the invention optionally comprises a pharmaceutically acceptable fatty acid and a pharmaceutically acceptable organic amine (also referred to herein as a “fatty acid/organic amine pair”) in total and relative amounts such that the composition is finely self-emulsifiable in simulated gastric fluid. “Simulated gastric fluid” and its abbreviation “SGF”, as the term is used 20 herein, describes an aqueous solution of 0.01M hydrochloric acid and 0.15M sodium chloride, having a pH of about 2. Without being bound by theory, it is believed that a fatty acid/organic amine pair, when present in a composition of the invention, promotes formation of charged fine-emulsion droplets upon exposure of the composition to an aqueous medium such as SGF.

25 Whether a composition is “finely self-emulsifiable” in SGF as defined herein can illustratively be determined according to Test I.

Test I:

- A. A 400  $\mu$ l aliquot of a test composition is placed into a screw-top, side-arm vessel containing 20 ml SGF (maintained at 37°C throughout the test) to form a test liquid.
- 30 B. The test liquid is mildly agitated at 75 rpm for 2 minutes using an orbital shaker, to permit emulsification.

- C. A 5–50  $\mu$ l aliquot of the test liquid is withdrawn through the side-arm using a pipette and is discharged from the pipette into a sampling vessel.
- D. A pump (*e.g.*, model RH0CKC-LF, Fluid Metering Inc., Syosset, NY) is used to pull the test liquid from the sampling vessel through a
- 5 combination scattering/obscuration sensor (*e.g.*, LE400-0.5, Particle Sizing Systems, Santa Barbara, CA) at a rate of 1 ml/minute for a period of 1 minute.
- E. Emulsion particles are counted individually by light scattering in the size (*i.e.*, diameter) range from 0.5 to 1  $\mu$ m and by light obscuration in the
- 10 size range above 1  $\mu$ m, using the vendor's software (*e.g.*, Version 1.59).
- F. A plot is prepared of number (*i.e.*, unweighted) or volume (*i.e.*, weighted) of emulsion particles versus particle diameter.
- G. Integration of the plot, accounting for all dilutions, is performed to
- 15 estimate total number or volume of emulsion particles present in the test liquid large enough to be detected by the sensor.
- H. If Test I results in about 25% or more, by volume, of emulsion particles having a diameter of 1  $\mu$ m or less, the test composition is deemed to be finely self-emulsifiable.

Preferred fatty acids have a saturated or unsaturated C<sub>6</sub>–24 carbon chain. Non-limiting examples of suitable fatty acids include oleic acid, octanoic acid, caproic acid, caprylic acid, capric acid, eleostearic acid, lauric acid, myristic acid, palmitic acid, stearic acid, icosanoic acid, elaidic acid, linoleic acid, linolenic acid, eicosapentaenoic acid and docosahexaenoic acid. Oleic acid is an especially preferred fatty acid.

Preferred organic amines have a C<sub>2</sub>–8 carbon chain with one or two amine groups. More preferably, organic amines can be selected from C<sub>2</sub>–8 alkyl amines, alkylene diamines, alkanol amines, alkylalkanol amines, glycol ether amines and aryl amines. Non-limiting examples of suitable organic amines include monoethanolamine, diethanolamine, triethanolamine, dimethylaminoethanol, tromethamine, *etc.* Particularly preferred organic amines are tertiary amines, for example triethanolamine and dimethylaminoethanol.

Preferably, if present, a fatty acid/organic amine pair is selected (as to both

type and amount of each component) such that when a composition of the invention is subjected to Test I, at least about 50% and more preferably at least about 75%, by volume, of the emulsion particles counted have a diameter of about 1  $\mu\text{m}$  or less. It is especially preferred that a substantial portion by volume of the emulsion particles 5 counted, more preferably at least about 75%, still more preferably at least about 85%, and most preferably at least about 90%, have a diameter of about 0.5  $\mu\text{m}$  or less.

A preferred mole ratio of fatty acid to amine group(s) in the organic amine is about 5:1 to about 1:100, more preferably about 3:1 to about 1:50, and still more preferably about 2:1 to about 1:10, for example about 1:1. Preferably, if present, the 10 fatty acid and organic amine are collectively present in an amount of about 1% to about 50%, more preferably about 2% to about 30%, and still more preferably about 5% to about 15%, by weight of the composition.

It is believed, without being bound by theory, that a finely self-emulsifiable solution composition of the invention, particularly one having a fatty acid/organic 15 amine pair as described above, will provide the drug in a form that is especially rapidly absorbable in the gastrointestinal tract.

In a solution composition of the invention, the drug, even when finely emulsified, can, upon exposure to the aqueous environment of the gastrointestinal tract, precipitate and agglomerate in a solid, typically crystalline, particulate form. 20 Such precipitation and/or crystallization can adversely impact any rapid-onset benefits obtained by administering a drug in dissolved form, because a drug that has reverted to a crystalline form must undergo the process of dissolution prior to absorption.

Therefore, preferred compositions further comprise a crystallization inhibitor, also referred to herein as a turbidity-decreasing polymer. We have discovered that 25 certain polymers can substantially inhibit precipitation and/or crystallization of a poorly water-soluble drug, when a solution of the drug in a substantially non-aqueous solvent is exposed to SGF. Accordingly, compositions of the present invention preferably comprise a turbidity-decreasing polymer. The polymer can be a cellulosic or non-cellulosic polymer and is preferably substantially water-soluble.

30 It will be understood that certain polymers are more effective at inhibiting precipitation and/or crystallization of a selected poorly water soluble drug than others, and that not all polymers inhibit precipitation and/or crystallization as described

herein of every poorly water-soluble drug. Whether a particular polymer is useful as a crystallization inhibitor for a particular poorly water soluble drug according to the present invention can be readily determined by one of ordinary skill in the art, for example according to Test II.

5                   Test II:

- A. A suitable amount of the drug is dissolved in a solvent (*e.g.*, ethanol, dimethyl sulfoxide or, where the drug is an acid or base, water) to obtain a concentrated drug solution.
- B. A volume of water or buffered solution with a fixed pH is placed in a first vessel and maintained at room temperature.
- 10                 C. An aliquot of the concentrated drug solution is added to the contents of the first vessel to obtain a first sample solution having a desired target drug concentration. The drug concentration selected should be one which produces substantial precipitation and consequently higher apparent absorbance (*i.e.*, turbidity) than a saturated solution having no such precipitation.
- 15                 D. A test polymer is selected and, in a second vessel, the polymer is dissolved in water or a buffered solution with a fixed pH (identical in composition, pH and volume to that used in step C) in an amount sufficient to form a 0.25% - 2% w/w polymer solution.
- 20                 E. To form a second sample solution, an aliquot of the concentrated drug solution prepared in step A is added to the polymer solution in the second vessel to form a sample solution having a final drug concentration equal to that of the first sample solution.
- 25                 F. At 60 minutes after preparation of both sample solutions, apparent absorbance (*i.e.*, turbidity) of each sample solution is measured using light having a wavelength of 650 nm;
- G. If the turbidity of the second sample solution is less than the turbidity of the first sample solution, the test polymer is deemed to be a "turbidity-decreasing polymer" and is useful as a crystallization inhibitor for the test drug.

30                 A technician performing Test II will readily find a suitable polymer

concentration for the test within the polymer concentration range provided above, by routine experimentation. In a particularly preferred embodiment, a concentration of the polymer is selected such that when Test II is performed, the apparent absorbance of the second sample solution is not greater than about 50% of the apparent 5 absorbance of the first sample solution.

In another embodiment, compositions of the invention comprise a crystallization inhibitor comprising at least one cellulosic polymer. Preferred cellulosic polymers are selected from HPMC, methylcellulose, ethylcellulose, sodium carboxymethylcellulose and hydroxypropylcellulose. More preferably, the at least one 10 cellulosic polymer is selected from cellulosic polymers having at least a portion of substitutable hydroxyl groups substituted with methoxyl and/or hydroxypropoxyl groups. Still more preferably, the at least one cellulosic polymer is HPMC.

HPMC useful as a crystallization inhibitor according to the invention preferably has a viscosity, 2% in water, of about 100 to about 20,000 cP. HPMCs 15 vary in the degree of substitution of available hydroxyl groups on the cellulosic backbone by methoxyl groups and by hydroxypropoxyl groups. With increasing hydroxypropoxyl substitution, the resulting HPMC becomes more hydrophilic in nature. It is preferred to use HPMC having about 15% to about 35%, more preferably about 19% to about 30%, and most preferably about 19% to about 24%, methoxyl 20 substitution, and having about 3% to about 15%, more preferably about 4% to about 12%, and most preferably about 7% to about 12%, hydroxypropoxyl substitution.

Suitable HPMCs that are relatively hydrophilic in nature are illustratively available under the brand names Methocel™ of Dow Chemical Co. and Metolose™ of Shin-Etsu Chemical Co.

25 An illustrative presently preferred HPMC is one with substitution type 2208, denoting about 19% to about 24% methoxyl substitution and about 7% to about 12% hydroxypropoxyl substitution, and with a nominal viscosity, 2% in water, of about 4000 cP.

Surprisingly, it has been found that the crystallization inhibitor need not be a 30 component of the solvent liquid. Optionally, a crystallization inhibitor such as HPMC can be a component of a capsule wall wherein a solution composition of the invention is encapsulated. In one embodiment, substantially no HPMC or other crystallization

inhibitor is present in the solvent liquid but the capsule wall comprises HPMC. The capsule wall can even consist predominantly of HPMC.

If present, the crystallization inhibitor is preferably present in a total amount sufficient to substantially inhibit drug crystallization and/or precipitation upon

5 dilution of the composition in SGF. An amount sufficient to “substantially inhibit drug crystallization and/or precipitation” herein means an amount sufficient to prevent, slow, inhibit or delay precipitation of drug from solution and/or to prevent, slow, inhibit or delay formation of crystalline drug particles from dissolved drug particles. For practical purposes, whether an amount of crystallization inhibitor in a  
10 given test composition is sufficient to substantially inhibit drug crystallization and/or precipitation can be determined according to Test III, which can also be used to determine whether a particular polymer component is useful as a crystallization inhibitor in a particular composition of the invention.

Test III:

15 A. A volume of a test composition, either in unencapsulated or encapsulated form, having a polymer component is placed in a volume of SGF to form a mixture having a fixed ratio of about 1 g to about 2 g of the composition per 100 ml of SGF.

20 B. The mixture is maintained at a constant temperature of about 37°C and is stirred using type II paddles (USP 24) at a rate of 75 rpm for a period of 4 hours.

25 C. At one or more time-points after at least about 15 minutes of stirring but before about 4 hours of stirring, an aliquot of the mixture is drawn and filtered, for example through a non-sterile Acrodisc™ syringe filter with a 0.8 µm Versapor™ membrane.

D. Filtrate is collected in a vessel.

E. Drug concentration in the filtrate is measured using high performance liquid chromatography (HPLC).

30 F. The test is repeated identically with a comparative composition that is substantially similar to the test composition except that it lacks the polymer component. Where the polymer component in the test composition is present in the solvent liquid, it is replaced in the

comparative composition by polyethylene glycol solvent. Where the polymer component in the test composition is present in a capsule wall, it is replaced in the comparative composition with gelatin.

5        G. If the drug concentration in the filtrate resulting from the test composition is greater than that in the filtrate resulting from the comparative composition, the polymer component present in the test composition is deemed to substantially inhibit crystallization and/or precipitation of the drug in SGF.

A crystallization inhibitor such as HPMC, when present in the solvent liquid, 10 is generally present in a total amount of about 1% to about 20%, preferably about 1% to about 15%, and most preferably about 1% to about 10%, by weight of the solvent liquid. Typically, the higher the drug concentration in the composition, the more of the cellulosic polymer will be required to provide a crystallization-inhibiting effect. 15 Generally, the crystallization inhibitor, if present, and the drug are present in a ratio of about 1:100 to about 1:1, preferably about 1:50 to about 1:1 and more preferably about 1:25 to about 1:1, by weight.

A composition of the invention optionally comprises one or more pharmaceutically acceptable sweeteners. Non-limiting examples of suitable sweeteners include mannitol, propylene glycol, sodium saccharin, acesulfame K, 20 neotame and aspartame. Alternatively or in addition, a viscous sweetener such as sorbitol solution, syrup (sucrose solution) or high-fructose corn syrup can be used and, in addition to sweetening effects, can also be useful to increase viscosity and to retard sedimentation. Use of sweeteners is especially advantageous in imbibable compositions of the invention, as these can be tasted by the subject prior to 25 swallowing. An encapsulated composition does not typically interact with the organs of taste in the mouth and use of a sweetener is normally unnecessary.

A composition of the invention optionally comprises one or more pharmaceutically acceptable preservatives other than free radical-scavenging 30 antioxidants. Non-limiting examples of suitable preservatives include benzalkonium chloride, benzethonium chloride, benzyl alcohol, chlorobutanol, phenol, phenylethyl alcohol, phenylmercuric nitrate, thimerosal, *etc.*

A composition of the invention optionally comprises one or more

pharmaceutically acceptable wetting agents. Surfactants, hydrophilic polymers and certain clays can be useful as wetting agents to aid in dissolution and/or dispersion of a hydrophobic drug such as celecoxib. Non-limiting examples of suitable surfactants include benzalkonium chloride, benzethonium chloride, cetylpyridinium chloride,

5 dioctyl sodium sulfosuccinate, nonoxynol 9, nonoxynol 10, octoxynol 9, poloxamers, polyoxyethylene (8) caprylic/capric mono- and diglycerides (*e.g.*, Labrasol<sup>TM</sup> of Gattefossé), polyoxyethylene (35) castor oil, polyoxyethylene (20) cetostearyl ether, polyoxyethylene (40) hydrogenated castor oil, polyoxyethylene (10) oleyl ether, polyoxyethylene (40) stearate, polysorbate 20, polysorbate 40, polysorbate 60,

10 polysorbate 80 (*e.g.*, Tween<sup>TM</sup> 80 of ICI), propylene glycol laurate (*e.g.*, Lauroglycol<sup>TM</sup> of Gattefossé), sodium lauryl sulfate, sorbitan monolaurate, sorbitan monooleate, sorbitan monopalmitate, sorbitan monostearate, tyloxapol, and mixtures thereof.

Additionally, compositions of the invention optionally comprise one or more pharmaceutically acceptable buffering agents, flavoring agents, colorants, stabilizers and/or thickeners. Buffers can be used to control pH of a formulation and can thereby modulate drug solubility. Flavoring agents can enhance patient compliance by making the composition more palatable, particularly in the case of an imbibable composition, and colorants can provide a product with a more aesthetic and/or distinctive appearance. Non-limiting examples of suitable colorants include D&C Red No. 33, FD&C Red No. 3, FD&C Red No. 40, D&C Yellow No. 10, and C Yellow No. 6.

#### Solution/suspension compositions

In one embodiment, the solvent liquid, depending on the particular components present therein, is suitable to maintain a first portion of drug in solution to provide a therapeutically effective rapid-onset dose while also maintaining a second portion of the drug undissolved but in suspension. The suspended portion typically provides less immediate release of the drug and so can extend the duration of therapeutic effect, although such extended duration is not a requirement of this embodiment of the invention.

Therefore, according to this embodiment a composition is provided comprising a therapeutically effective amount of a poorly water-soluble

aminosulfonyl-comprising drug, in part dissolved and in part dispersed in a solvent liquid that comprises at least one pharmaceutically acceptable polyethylene glycol and at least one pharmaceutically acceptable free radical-scavenging antioxidant. In this embodiment, part of the drug is in solution and part is in suspension.

5 Preferably, the components of the solvent liquid are selected such that at least about 15% by weight of the drug is in dissolved or solubilized form in the solvent liquid. One way of modifying a solvent liquid to increase the amount of the poorly water soluble aminosulfonyl-comprising drug in suspension as opposed to solution is to add water in an amount necessary to give the required reduction in solubility of the  
10 drug in the solvent liquid.

Depending on the relative importance of rapid onset and sustained action for the indication for which the drug is being administered, the relative proportions of dissolved and suspended drug can be varied significantly. For example, for acute pain indications, about 50% of the drug can be in solution and about 50% of the drug can  
15 be dispersed in particulate form. Alternatively, for indications demanding longer acting therapeutic effectiveness, illustratively about 20% of the drug can be in solution and about 80% of the drug can be dispersed in particulate form.

The particulate form of the drug can be generated mechanically, for example by milling or grinding, or by precipitation from solution. Particles formed directly  
20 from such processes are described herein as "primary particles" and can agglomerate to form secondary aggregate particles. The term "particle size" as used herein refers to size, in the longest dimension, of primary particles, unless the context demands otherwise. Particle size is believed to be an important parameter affecting the clinical effectiveness of celecoxib and other drugs of low water solubility.

25 Particle size can be expressed as the percentage of total particles that have a diameter smaller than a given reference diameter. For example, a useful parameter is "D<sub>90</sub> particle size". By definition, in a batch of a drug that has a D<sub>90</sub> particle size of 60  $\mu\text{m}$ , 90% of the particles, by volume, have a diameter less than 60  $\mu\text{m}$ . For practical purposes a determination of D<sub>90</sub> based on 90% by weight rather than by  
30 volume is generally suitable.

Compositions of this embodiment preferably have a distribution of suspended drug particle sizes such that D<sub>90</sub> of the particles, in their longest dimension, is about

0.5  $\mu\text{m}$  to about 200  $\mu\text{m}$ , preferably about 0.5  $\mu\text{m}$  to about 75  $\mu\text{m}$ , and more preferably about 0.5  $\mu\text{m}$  to about 25  $\mu\text{m}$ . For example, where the drug is celecoxib, a decrease in particle size in accordance with this embodiment of the invention generally improves drug bioavailability. In addition or alternatively, suspended celecoxib particles in a 5 composition of the invention preferably have a mean particle size less than about 10  $\mu\text{m}$ , more preferably about 0.1  $\mu\text{m}$  to about 10  $\mu\text{m}$ , and most preferably about 0.5  $\mu\text{m}$  to about 5  $\mu\text{m}$ , for example about 1  $\mu\text{m}$ .

Compositions of this embodiment can optionally comprise additional 10 excipients such as crystallization inhibitors, dispersants, co-solvents, sweeteners, preservatives, emulsifying agents, *etc.*, as described above. Further, compositions of this embodiment can be formulated either in imbibable or discrete dosage form.

Additionally, certain excipients such as suspending agents, thickening agents and flocculating agents can be particularly useful where suspended drug particles are desired, for example in solution/suspension compositions. Through selection and 15 combination of excipients, solution/suspension compositions can be provided exhibiting improved performance with respect to drug concentration, physical stability, efficacy, flavor, and overall patient compliance.

Solution/suspension compositions of the invention optionally comprise one or 20 more pharmaceutically acceptable suspending agents. Suspending agents are used to impart increased viscosity and retard sedimentation. Suspending agents are of various classes including cellulose derivatives, clays, natural gums, synthetic gums and miscellaneous agents. Non-limiting examples of suspending agents that can be used in compositions of the present invention include acacia, agar, alginic acid, aluminum monostearate, attapulgite, bentonite, carboxymethylcellulose calcium, 25 carboxymethylcellulose sodium, carrageenan, carbomer, for example carbomer 910, dextrin, ethylmethylcellulose, gelatin, guar gum, HPMC, methylcellulose, ethylcellulose, ethylhydroxyethylcellulose, hydroxyethylcellulose, hydroxypropylcellulose, kaolin, magnesium aluminum silicate, microcrystalline cellulose, microcrystalline cellulose with carboxymethylcellulose sodium, powdered 30 cellulose, silica gel, colloidal silicon dioxide, locust bean gum, pectin, sodium alginate, propylene glycol alginate, tamarind gum, tragacanth, xanthan gum, povidone, veegum, glycyrrhizin, pregelatinized starch, sodium starch glycolate and mixtures

thereof.

In certain circumstances, it can be desirable to use flocculating agents in solution/suspension compositions of the invention. Flocculating agents enable particles to link together in loose aggregates or flocs and include surfactants, 5 hydrophilic polymers, clays and electrolytes. Non-limiting examples of suitable flocculating agents include sodium lauryl sulfate, docusate sodium, benzalkonium chloride, cetylpyridinium chloride, polysorbate 80, sorbitan monolaurate, carboxymethylcellulose sodium, xanthan gum, tragacanth, methylcellulose, PEG, magnesium aluminum silicate, attapulgite, bentonite, potassium dihydrogen 10 phosphate, aluminum chloride, sodium chloride and mixtures thereof.

Discrete dosage forms

It has been found that the demands of a rapid-onset formulation are met surprisingly well by a preparation containing a solution or solution/suspension of the present invention encapsulated as a discrete dosage unit article. Therefore, another 15 embodiment of the present invention is a concentrated composition, either a solution or solution/suspension, wherein the composition is formulated as one or more discrete dose units, for example soft or hard capsules.

Any suitable encapsulation material, for example gelatin or HPMC, can be used. As indicated hereinabove, HPMC can be an advantageous material for use in 20 the capsule wall because it can act as a crystallization inhibitor upon exposure of the composition to gastrointestinal fluid. A polymer component such as HPMC is “present in the capsule wall” or is a “capsule wall component” as described herein if the polymer is (a) dispersed or mixed together with any other capsule wall component(s), (b) the only capsule wall component, or (c) present as a coating on the 25 outside or inside of the capsule wall.

In a presently preferred embodiment, a crystallization inhibitor, preferably a polymer having methoxyl and/or hydroxypropoxyl substitution as described hereinabove, and more preferably HPMC, is present in the capsule wall in a total amount of about 5% to substantially 100%, and preferably about 15% to substantially 30 100%, by weight of the wall.

The crystallization inhibitor is preferably present in the wall in a total amount sufficient to substantially inhibit drug crystallization and/or precipitation upon

dissolution, dilution and/or degradation of the composition in SGF. For practical purposes, whether an amount of crystallization inhibitor present in the wall of a given test composition is sufficient to substantially inhibit drug crystallization and/or precipitation can be determined according to Test IV, which can also be used to 5 determine whether a particular polymer component is useful as a crystallization inhibitor when present in the capsule wall of a particular composition of the invention.

Test IV:

- A. A volume of a solution or solution/suspension as described herein above is enclosed in a capsule comprising a test polymer to form a test 10 composition, and is placed in a volume of SGF to form a mixture having a fixed ratio of about 1 g to about 2 g of the composition per 100 ml of SGF.
- B. The mixture is maintained at a constant temperature of about 37°C and is stirred using type II paddles (USP 24) at a rate of 75 rpm for a period of 15 4 hours.
- C. At one or more time-points after at least about 15 minutes of stirring but before about 4 hours of stirring, an aliquot of the mixture is drawn and filtered, for example through a non-sterile Acrodisc™ syringe filter with a 0.8 µm Versapor™ membrane.
- D. Filtrate is collected in a vessel.
- E. Drug concentration in the filtrate is measured using high performance liquid chromatography (HPLC).
- F. The test is repeated identically with a comparative composition 20 comprising a solution or solution/suspension that is substantially similar to the solution or solution/suspension used in Step A but which is enclosed in a capsule comprising no crystallization inhibitor (*i.e.* comprises no polymer or, if a polymer is present, it is a polymer such as gelatin which does not inhibit crystallization and/or precipitation). The polymer component is replaced in the capsule enclosing the comparative 25 composition with gelatin.
- G. If the drug concentration in the filtrate resulting from the test 30 composition is greater than that in the filtrate resulting from the

comparative composition, the polymer component present in the capsule wall of the test composition is deemed to be present in an amount sufficient to substantially inhibit crystallization and/or precipitation of the drug in SGF.

5        In addition to one or more such crystallization inhibitors, a suitable capsule wall can comprise any additional component useful in the art such as gelatin, starch, carrageenan, sodium alginate, plasticizers, potassium chloride, coloring agents, *etc.* A suitable capsule herein may have a hard or soft wall.

10      Preferably, one to about six, more preferably one to about four, and still more preferably one or two of such discrete dosage units per day provides a therapeutically effective dose of the drug.

15      Compositions of this embodiment are preferably formulated such that each discrete dosage unit contains about 0.3 ml to about 1.5 ml, more preferably about 0.3 ml to about 1 ml, for example about 0.8 ml or about 0.9 ml, of solution or solution/suspension.

20      Concentrated solutions or solutions/suspensions can be encapsulated by any method known in the art including the plate process, vacuum process, or the rotary die process. See, for example, Ansel *et al.* (1995) in Pharmaceutical Dosage Forms and Drug Delivery Systems, 6th ed., Williams & Wilkins, Baltimore, MD, pp. 176-182.

25      By the rotary die process, liquid encapsulation material, for example gelatin, flowing from an overhead tank is formed into two continuous ribbons by a rotary die machine and brought together by twin rotating dies. Simultaneously, metered fill material is injected between ribbons at the same moment that the dies form pockets of the ribbons. These pockets of fill-containing encapsulation material are then sealed by pressure and heat, and the capsules are served from the machine.

Soft capsules can be manufactured in different shapes including round, oval, oblong, and tube-shape, among others. Additionally, by using two different ribbon colors, two-tone capsules can be produced.

30      Capsules that comprise HPMC are known in the art and can be prepared, sealed and/or coated, by way of non-limiting illustration, according to processes disclosed in the patents and publications listed below, each of which is individually incorporated herein by reference.

include XGel<sup>TM</sup> capsules of Bioprogress and Qualicaps<sup>TM</sup> of Shionogi.

15 Imbibable dosage forms

Another embodiment of the present invention is a concentrated composition, either a concentrated solution or a concentrated solution/suspension, that can be directly imbibed or diluted with inert diluents and/or other carriers and imbibed; such compositions of the invention, whether diluted or not, are referred to for convenience 20 herein as "imbibable compositions". Imbibable compositions can be prepared by any suitable method of pharmacy that includes the steps of bringing into association the drug of low water solubility, illustratively celecoxib, and the solvent liquid. Where the drug is celecoxib, compositions of this embodiment preferably contain about 40 mg/ml to about 750 mg/ml, more preferably about 50 mg/ml to about 500 mg/ml, still 25 more preferably about 50 mg/ml to about 350 mg/ml, and most preferably, about 100 mg/ml to about 300 mg/ml, for example about 200 mg/ml, of celecoxib.

In a further embodiment, solutions or solution/suspensions of the invention are provided that are required to be diluted to provide a dilution suitable for direct, imbibable administration. In this embodiment, solutions or solution/suspensions of 30 the present invention are added, in a therapeutically effective dosage amount, to about 1 ml to about 20 ml of an inert liquid. Preferably solutions or solution/suspensions of the present invention are added to about 2 ml to about 15 ml, and more preferably to

about 5 ml to about 10 ml, of inert liquid. The term "inert liquid" as used herein refers to pharmaceutically acceptable, preferably palatable liquid carriers. Such carriers are typically aqueous. Examples include water, fruit juices, carbonated beverages, *etc.*

5    Utility of compositions that comprise a selective COX-2 inhibitory drug

In a preferred embodiment, compositions of the invention comprise an aminosulfonyl-comprising selective COX-2 inhibitory drug of low water solubility. Compositions of this embodiment are useful in treatment and prevention of a very wide range of disorders mediated by COX-2, including but not restricted to disorders 10 characterized by inflammation, pain and/or fever. Such compositions are especially useful as anti-inflammatory agents, such as in treatment of arthritis, with the additional benefit of having significantly less harmful side effects than compositions of conventional nonsteroidal anti-inflammatory drugs (NSAIDs) that lack selectivity for COX-2 over COX-1. In particular, such compositions have reduced potential for 15 gastrointestinal toxicity and gastrointestinal irritation including upper gastrointestinal ulceration and bleeding, reduced potential for renal side effects such as reduction in renal function leading to fluid retention and exacerbation of hypertension, reduced effect on bleeding times including inhibition of platelet function, and possibly a lessened ability to induce asthma attacks in aspirin-sensitive asthmatic subjects, by 20 comparison with compositions of conventional NSAIDs. Thus compositions of the invention comprising a selective COX-2 inhibitory drug are particularly useful as an alternative to conventional NSAIDs where such NSAIDs are contraindicated, for example in patients with peptic ulcers, gastritis, regional enteritis, ulcerative colitis, diverticulitis or with a recurrent history of gastrointestinal lesions; gastrointestinal 25 bleeding, coagulation disorders including anemia such as hypoprothrombinemia, hemophilia or other bleeding problems; kidney disease; or in patients prior to surgery or patients taking anticoagulants.

Such compositions are useful to treat a variety of arthritic disorders, including but not limited to rheumatoid arthritis, spondyloarthropathies, gouty arthritis, 30 osteoarthritis, systemic lupus erythematosus and juvenile arthritis.

Such compositions are also useful in treatment of asthma, bronchitis, menstrual cramps, preterm labor, tendinitis, bursitis, allergic neuritis, cytomegalovirus

infectivity, apoptosis including HIV-induced apoptosis, lumbago, liver disease including hepatitis, skin-related conditions such as psoriasis, eczema, acne, burns, dermatitis and ultraviolet radiation damage including sunburn, and post-operative inflammation including that following ophthalmic surgery such as cataract surgery or 5 refractive surgery.

Such compositions are useful to treat gastrointestinal conditions such as inflammatory bowel disease, Crohn's disease, gastritis, irritable bowel syndrome and ulcerative colitis.

Such compositions are useful in treating inflammation in such diseases as 10 migraine headaches, periarteritis nodosa, thyroiditis, aplastic anemia, Hodgkin's disease, sclerodoma, rheumatic fever, type I diabetes, neuromuscular junction disease including myasthenia gravis, white matter disease including multiple sclerosis, sarcoidosis, nephrotic syndrome, Behcet's syndrome, polymyositis, gingivitis, nephritis, hypersensitivity, swelling occurring after injury including brain edema, 15 myocardial ischemia, and the like.

Such compositions are useful in treatment of ophthalmic diseases, such as retinitis, conjunctivitis, retinopathies, uveitis, ocular photophobia, and of acute injury to the eye tissue.

Such compositions are useful in treatment of pulmonary inflammation, such as 20 that associated with viral infections and cystic fibrosis, and in bone resorption such as that associated with osteoporosis.

Such compositions are useful for treatment of certain central nervous system disorders, such as cortical dementias including Alzheimer's disease, 25 neurodegeneration, and central nervous system damage resulting from stroke, ischemia and trauma. The term "treatment" in the present context includes partial or total inhibition of dementias, including Alzheimer's disease, vascular dementia, multi-infarct dementia, pre-senile dementia, alcoholic dementia and senile dementia.

Such compositions are useful in treatment of allergic rhinitis, respiratory distress syndrome, endotoxin shock syndrome and liver disease.

30 Such compositions are useful in treatment of pain, including but not limited to postoperative pain, dental pain, muscular pain, and pain resulting from cancer. For example, such compositions are useful for relief of pain, fever and inflammation in a

variety of conditions including rheumatic fever, influenza and other viral infections including common cold, low back and neck pain, dysmenorrhea, headache, toothache, sprains and strains, myositis, neuralgia, synovitis, arthritis, including rheumatoid arthritis, degenerative joint diseases (osteoarthritis), gout and ankylosing spondylitis, 5 bursitis, burns, and trauma following surgical and dental procedures.

Such compositions are useful for treating and preventing inflammation-related cardiovascular disorders, including vascular diseases, coronary artery disease, aneurysm, vascular rejection, arteriosclerosis, atherosclerosis including cardiac transplant atherosclerosis, myocardial infarction, embolism, stroke, thrombosis 10 including venous thrombosis, angina including unstable angina, coronary plaque inflammation, bacterial-induced inflammation including Chlamydia-induced inflammation, viral induced inflammation, and inflammation associated with surgical procedures such as vascular grafting including coronary artery bypass surgery, revascularization procedures including angioplasty, stent placement, endarterectomy, 15 or other invasive procedures involving arteries, veins and capillaries.

Such compositions are useful in treatment of angiogenesis-related disorders in a subject, for example to inhibit tumor angiogenesis. Such compositions are useful in treatment of neoplasia, including metastasis; ophthalmological conditions such as corneal graft rejection, ocular neovascularization, retinal neovascularization including 20 neovascularization following injury or infection, diabetic retinopathy, macular degeneration, retrolental fibroplasia and neovascular glaucoma; ulcerative diseases such as gastric ulcer; pathological, but non-malignant, conditions such as hemangiomas, including infantile hemangiomas, angiofibroma of the nasopharynx and avascular necrosis of bone; and disorders of the female reproductive system such as 25 endometriosis.

Such compositions are useful in prevention and treatment of benign and malignant tumors and neoplasia including cancer, such as colorectal cancer, brain cancer, bone cancer, epithelial cell-derived neoplasia (epithelial carcinoma) such as basal cell carcinoma, adenocarcinoma, gastrointestinal cancer such as lip cancer, 30 mouth cancer, esophageal cancer, small bowel cancer, stomach cancer, colon cancer, liver cancer, bladder cancer, pancreas cancer, ovary cancer, cervical cancer, lung cancer, breast cancer, skin cancer such as squamous cell and basal cell cancers,

prostate cancer, renal cell carcinoma, and other known cancers that effect epithelial cells throughout the body. Neoplasias for which compositions of the invention are contemplated to be particularly useful are gastrointestinal cancer, Barrett's esophagus, liver cancer, bladder cancer, pancreatic cancer, ovarian cancer, prostate cancer,

5       cervical cancer, lung cancer, breast cancer and skin cancer. Such compositions can also be used to treat fibrosis that occurs with radiation therapy. Such compositions can be used to treat subjects having adenomatous polyps, including those with familial adenomatous polyposis (FAP). Additionally, such compositions can be used to prevent polyps from forming in patients at risk of FAP.

10       Such compositions inhibit prostanoid-induced smooth muscle contraction by inhibiting synthesis of contractile prostanoids and hence can be of use in treatment of dysmenorrhea, premature labor, asthma and eosinophil-related disorders. They also can be of use for decreasing bone loss particularly in postmenopausal women (*i.e.*, treatment of osteoporosis), and for treatment of glaucoma.

15       Because of the rapid onset of therapeutic effect that can be exhibited by compositions of the invention, these compositions have particular advantages over prior formulations for treatment of acute COX-2 mediated disorders, especially for relief of pain, for example in headache, including sinus headache and migraine.

20       Preferred uses for compositions of the present invention are for treatment of rheumatoid arthritis and osteoarthritis, for pain management generally (particularly post-oral surgery pain, post-general surgery pain, post-orthopedic surgery pain, and acute flares of osteoarthritis), for prevention and treatment of headache and migraine, for treatment of Alzheimer's disease, and for colon cancer chemoprevention.

25       For treatment of rheumatoid arthritis or osteoarthritis, such compositions of the invention can be used to provide a daily dosage of celecoxib of about 50 mg to about 1000 mg, preferably about 100 mg to about 600 mg, more preferably about 150 mg to about 500 mg, still more preferably about 175 mg to about 400 mg, for example about 200 mg. A daily dose of celecoxib of about 0.7 to about 13 mg/kg body weight, preferably about 1.3 to about 8 mg/kg body weight, more preferably about 2 to about 30       6.7 mg/kg body weight, and still more preferably about 2.3 to about 5.3 mg/kg body weight, for example about 2.7 mg/kg body weight, is generally appropriate when administered in a composition of the invention. The daily dose can be administered in

one to about four doses per day, preferably one or two doses per day.

For treatment of Alzheimer's disease or cancer, such compositions of the invention can be used to provide a daily dosage of celecoxib of about 50 mg to about 1000 mg, preferably about 100 mg to about 800 mg, more preferably about 150 mg to 5 about 600 mg, and still more preferably about 175 mg to about 400 mg, for example about 400 mg. A daily dose of about 0.7 to about 13 mg/kg body weight, preferably about 1.3 to about 10.7 mg/kg body weight, more preferably about 2 to about 8 mg/kg body weight, and still more preferably about 2.3 to about 5.3 mg/kg body weight, for example about 5.3 mg/kg body weight, is generally appropriate when administered in 10 a composition of the invention. The daily dose can be administered in one to about four doses per day, preferably one or two doses per day.

For pain management generally and specifically for treatment and prevention of headache and migraine, such compositions of the invention can be used to provide a daily dosage of celecoxib of about 50 mg to about 1000 mg, preferably about 100 mg to about 600 mg, more preferably about 150 mg to about 500 mg, and still more preferably about 175 mg to about 400 mg, for example about 200 mg. A daily dose of celecoxib of about 0.7 to about 13 mg/kg body weight, preferably about 1.3 to about 8 mg/kg body weight, more preferably about 2 to about 6.7 mg/kg body weight, and still more preferably about 2.3 to about 5.3 mg/kg body weight, for example about 2.7 15 mg/kg body weight, is generally appropriate when administered in a composition of the invention. The daily dose can be administered in one to about four doses per day. Administration at a rate of one 50 mg dose unit four times a day, one 100 mg dose unit or two 50 mg dose units twice a day or one 200 mg dose unit, two 100 mg dose units or four 50 mg dose units once a day is preferred.

20 For selective COX-2 inhibitory drugs other than celecoxib, appropriate doses can be selected by reference to the patent literature cited hereinabove.

Besides being useful for human treatment, such compositions of the invention 25 are useful for veterinary treatment of companion animals, exotic animals, farm animals, and the like, particularly mammals. More particularly, such compositions of the invention are useful for treatment of COX-2 mediated disorders in horses, dogs 30 and cats.

This embodiment of the invention is further directed to a therapeutic method

of treating a condition or disorder where treatment with a COX-2 inhibitory drug is indicated, the method comprising oral administration of a composition of the invention to a subject in need thereof. The dosage regimen to prevent, give relief from, or ameliorate the condition or disorder preferably corresponds to once-a-day or 5 twice-a-day treatment, but can be modified in accordance with a variety of factors. These include the type, age, weight, sex, diet and medical condition of the subject and the nature and severity of the disorder. Thus, the dosage regimen actually employed can vary widely and can therefore deviate from the preferred dosage regimens set forth above.

10       Initial treatment can begin with a dose regimen as indicated above. Treatment is generally continued as necessary over a period of several weeks to several months or years until the condition or disorder has been controlled or eliminated. Subjects undergoing treatment with a composition of the invention can be routinely monitored by any of the methods well known in the art to determine effectiveness of therapy.

15       Continuous analysis of data from such monitoring permits modification of the treatment regimen during therapy so that optimally effective doses are administered at any point in time, and so that the duration of treatment can be determined. In this way, the treatment regimen and dosing schedule can be rationally modified over the course of therapy so that the lowest amount of the composition exhibiting satisfactory 20 effectiveness is administered, and so that administration is continued only for so long as is necessary to successfully treat the condition or disorder.

Compositions of the present embodiment can be used in combination therapies with opioids and other analgesics, including narcotic analgesics, Mu receptor antagonists, Kappa receptor antagonists, non-narcotic (i.e. non-addictive) analgesics, 25 monoamine uptake inhibitors, adenosine regulating agents, cannabinoid derivatives, Substance P antagonists, neurokinin-1 receptor antagonists and sodium channel blockers, among others. Preferred combination therapies comprise use of a composition of the invention with one or more compounds selected from aceclofenac, acemetacin, *e*-acetamidocaproic acid, acetaminophen, acetaminosalol, acetanilide, 30 acetylsalicylic acid (aspirin), *S*-adenosylmethionine, alclofenac, alfentanil, allylprodine, alminoprofen, aloxiprin, alphaprodine, aluminum bis(acetylsalicylate), amfenac, aminochlorthenoxyazin, 3-amino-4-hydroxybutyric acid, 2-amino-4-picoline,

aminopropylon, aminopyrine, amixetrine, ammonium salicylate, ampiroxicam, amtolmetin guacil, anileridine, antipyrine, antipyrine salicylate, antrafenine, apazone, bendazac, benorylate, benoxaprofen, benzpiperylon, benzydamine, benzylmorphine, bermoprofen, bezitramide,  $\alpha$ -bisabolol, bromfenac, *p*-bromoacetanilide,

5 5-bromosalicylic acid acetate, bromosaligenin, bucetin, bucloxic acid, bucolome, bufexamac, bumadizon, buprenorphine, butacetin, butibufen, butophanol, calcium acetylsalicylate, carbamazepine, carbiphene, carprofen, carsalam, chlorobutanol, chlorthenoxazin, choline salicylate, cinchophen, cinmetacin, ciramadol, clidanac, clometacin, clonitazene, clonixin, clopirac, clove, codeine, codeine methyl bromide,

10 codeine phosphate, codeine sulfate, cropropamide, crotethamide, desomorphine, dexoxadrol, dextromoramide, dezocine, diampromide, diclofenac sodium, difenamizole, difenpiramide, diflunisal, dihydrocodeine, dihydrocodeinone enol acetate, dihydromorphine, dihydroxyaluminum acetylsalicylate, dimenoxadol, dimepheptanol, dimethylthiambutene, dioxaphetyl butyrate, dipipanone, diprocetyl,

15 dipyrone, ditazol, droxicam, emorfazone, enfenamic acid, epirizole, eptazocine, etersalate, ethenzamide, ethoheptazine, ethoxazene, ethylmethylthiambutene, ethylmorphine, etodolac, etofenamate, etonitazene, eugenol, felbinac, fenbufen, fenclozic acid, fendosal, fenoprofen, fentanyl, fentiazac, fepradinol, feprazone, floctafenine, flufenamic acid, flunoxaprofen, fluoresone, flupirtine, fluproquazone,

20 flurbiprofen, fosfosal, gentisic acid, glafenine, glucametacin, glycol salicylate, guaiazulene, hydrocodone, hydromorphone, hydroxypethidine, ibufenac, ibuprofen, ibuproxam, imidazole salicylate, indomethacin, indoprofen, isofezolac, isoladol, isomethadone, isonixin, isoxepac, isoxicam, ketobemidone, ketoprofen, ketorolac, *p*-lactophenetide, lefetamine, levorphanol, lofentanil, lonazolac, lornoxicam,

25 loxoprofen, lysine acetylsalicylate, magnesium acetylsalicylate, meclofenamic acid, mefenamic acid, meperidine, meptazinol, mesalamine, metazocine, methadone hydrochloride, methotriprazine, metiazinic acid, metofoline, metopon, mofebutazone, mofezolac, morazone, morphine, morphine hydrochloride, morphine sulfate, morpholine salicylate, myrophine, nabumetone, nalbuphine, 1-naphthyl

30 salicylate, naproxen, narceine, nefopam, nicomorphine, nifenazone, niflumic acid, nimesulide, 5'-nitro-2'-prooxyacetanilide, norlevorphanol, normethadone, normorphine, norpipanone, olsalazine, opium, oxaceprol, oxametacine, oxaprozin,

oxycodone, oxymorphone, oxyphenbutazone, papaveretum, paranyline, parsalmide, pentazocine, perisoxal, phenacetin, phenadoxone, phenazocine, phenazopyridine hydrochloride, phenocoll, phenoperidine, phenopyrazone, phenyl acetylsalicylate, phenylbutazone, phenyl salicylate, phenyramidol, pikedoprofen, piminodine, 5 pipebuzone, piperylone, piprofen, pirazolac, piritramide, piroxicam, pranoprofen, proglumetacin, proheptazine, promedol, propacetamol, propiram, propoxyphene, propyphenazone, proquazone, protizinic acid, ramifenazone, remifentanil, rimazolium metilsulfate, salacetamide, salicin, salicylamide, salicylamide *o*-acetic acid, salicylsulfuric acid, salsalte, salverine, simetride, sodium salicylate, sufentanil, 10 sulfasalazine, sulindac, superoxide dismutase, suprofen, suxibuzone, talniflumate, tenidap, tenoxicam, terofenamate, tetradrine, thiazolinobutazone, tiaprofenic acid, tiaramide, tilidine, tinoridine, tolfenamic acid, tolmetin, tramadol, tropesin, viminol, xenbucin, ximoprofen, zaltoprofen and zomepirac (see The Merck Index, 12th Edition (1996), Therapeutic Category and Biological Activity Index, lists therein headed 15 "Analgesic", "Anti-inflammatory" and "Antipyretic").

Particularly preferred combination therapies comprise use of a composition of this embodiment with an opioid compound, more particularly where the opioid compound is codeine, meperidine, morphine or a derivative thereof.

The compound to be administered in combination with a selective COX-2 20 inhibitory drug can be formulated separately from the drug or co-formulated with the drug in a composition of the invention. Where a selective COX-2 inhibitory drug is co-formulated with a second drug, for example an opioid drug, the second drug can be formulated in immediate-release, rapid-onset, sustained-release or dual-release form.

In an embodiment of the invention, particularly where the COX-2 mediated 25 condition is headache or migraine, the present selective COX-2 inhibitory drug composition is administered in combination therapy with a vasomodulator, preferably a xanthine derivative having vasomodulatory effect, more preferably an alkylxanthine compound.

Combination therapies wherein an alkylxanthine compound is co-administered 30 with a selective COX-2 inhibitory drug composition as provided herein are embraced by the present embodiment of the invention whether or not the alkylxanthine is a vasomodulator and whether or not the therapeutic effectiveness of the combination is

to any degree attributable to a vasomodulatory effect. The term "alkylxanthine" herein embraces xanthine derivatives having one or more C<sub>1-4</sub> alkyl, preferably methyl, substituents, and pharmaceutically acceptable salts of such xanthine derivatives. Dimethylxanthines and trimethylxanthines, including caffeine, 5 theobromine and theophylline, are especially preferred. Most preferably, the alkylxanthine compound is caffeine.

The total and relative dosage amounts of the selective COX-2 inhibitory drug and of the vasomodulator or alkylxanthine are selected to be therapeutically and/or prophylactically effective for relief of pain associated with the headache or migraine. 10 Suitable dosage amounts will depend on the particular selective COX-2 inhibitory drug and the particular vasomodulator or alkylxanthine selected. For example, in a combination therapy with celecoxib and caffeine, typically the celecoxib will be administered in a daily dosage amount of about 50 mg to about 1000 mg, preferably about 100 mg to about 600 mg, and the caffeine in a daily dosage amount of about 15 1 mg to about 500 mg, preferably about 10 mg to about 400 mg, more preferably about 20 mg to about 300 mg.

The vasomodulator or alkylxanthine component of the combination therapy can be administered in any suitable dosage form by any suitable route, preferably orally. The vasomodulator or alkylxanthine can optionally be coformulated with the 20 selective COX-2 inhibitory drug in a single oral dosage form. Thus a solution or solution/suspension formulation of the invention optionally comprises both an aminosulfonyl-comprising selective COX-2 inhibitory drug and a vasomodulator or alkylxanthine such as caffeine, in total and relative amounts consistent with the dosage amounts set out hereinabove.

25 The phrase "in total and relative amounts effective to relieve pain", with respect to amounts of a selective COX-2 inhibitory drug and a vasomodulator or alkylxanthine in a composition of the present embodiment, means that these amounts are such that (a) together these components are effective to relieve pain, and (b) each component is or would be capable of contribution to a pain-relieving effect if the other 30 component is or were not present in so great an amount as to obviate such contribution.

## EXAMPLES

Example 1

Six celecoxib solution formulations SF-1 to SF-6 were prepared having components as shown in Table 1. In each case the solvent liquid consisted of 5 PEG-400, either alone (SF-1) or together with at least one free radical-scavenging antioxidant (SF-2 to SF-6). Celecoxib was present in solution at a concentration of 50 mg/g in all formulations. Antioxidant amounts are shown as % weight/weight.

**Table 1. Composition of celecoxib solution formulations SF-1 to SF-6**

Formulation	Components
SF-1	Celecoxib, PEG-400
SF-2	Celecoxib, PEG-400, 0.1% vitamin E
SF-3	Celecoxib, PEG-400, 0.1% BHA
SF-4	Celecoxib, PEG-400, 0.1% BHT
SF-5	Celecoxib, PEG-400, 0.1% propyl gallate
SF-6	Celecoxib, PEG-400, 0.05% BHA, 0.05% BHT

Example 2

10 A gradient HPLC assay was used to determine impurities in celecoxib solution formulations SF-1 to SF-6 of Example 1 after storage at various temperatures for different periods of time. Solution formulation samples were drawn and were dissolved in methanol to obtain a celecoxib concentration of about 0.4 to about 0.5 mg/ml prior to injection. Chromatographic conditions were as follows: (a) flow rate: 15 1 ml/min.; (b) detection: UV 254 nm; (c) injection volume: 10 µl; (d) column: 5 µm Supercosil, LC-DP, 250 x 4.6 mm; (e) column temperature: 40°C; (f) mobile phase A: 10 mM NH<sub>4</sub>AC or KH<sub>2</sub>PO<sub>4</sub>, pH 3; (g) mobile phase B: 100% acetonitrile; (h) running time: 45 minutes. Data are shown in Tables 2 and 3.

**Table 2. Impurity level (%) in formulations SF-1 to SF-5 following storage**

Formulation	days stored at 70°C							
	9	14	16	20	28	33	35	90

SF-4		0.03		0.04		0.06		0.30
SF-5		ND		ND		ND		0.15

20 ND = None detected

**Table 3. Impurity level (%) in formulations SF-1, SF-2, SF-5 and SF-6 following storage at different temperatures**

Formulation	Days	Temperature			
		50°C	40°C	25°C	4°C
SF-1	0	0.00	0.00	0.00	0.00
	7	0.09			
	21	4.12	0.11	0.00	
	31	6.25			0.00
	74	7.83	5.40	0.08	0.00
	131	7.85	6.87	0.44	0.00
SF-2	0	0.00	0.00	0.00	0.00
	7	0.00			
	21	0.02	0.00	0.00	
	31	0.01			0.00
	74	0.06	0.02	0.00	0.00
	131	0.07	0.01	0.00	0.00
SF-5	0	0.00	0.00	0.00	0.00
	7	0.02			
	21	0.05	0.03	0.02	
	31	0.05			0.00
	74	0.15	0.11	0.03	0.00
	131	0.20	0.09	0.02	0.00
SF-6	0	0.00	0.00	0.00	0.00
	7	0.00			
	21	0.01	0.01	0.00	
	31	0.01			0.00
	74	0.03	0.02	0.01	0.00
	131	0.06	0.01	0.00	0.00

The data in Tables 2 and 3 indicate that the presence of a small amount of a free radical-scavenging antioxidant such as vitamin E, butyl gallate, BHA or BHT 5 greatly improves chemical stability of celecoxib dissolved in PEG-400 by comparison with compositions comprising no such antioxidant.

**Example 3**

Solution formulation SF-1 of Example 1 was bubbled with ethylene oxide, a putative source of free radicals, for 15 minutes, and was then stored at 70°C for 10 days. After storage, the formulation was analyzed for the presence of impurities. 10 Addition compounds detected therein were isolated by reversed-phase, semi-preparative HPLC. A 20 x 250 mm Kromasil C18 column was employed with either an isocratic or a gradient, acetonitrile-aqueous trifluoroacetic acid mobile phase.

Detection was accomplished at 254 nm. Pooled fractions containing individual addition compounds, herein referred to as Peak 1, Peak 2 and Peak 3 addition compounds, were concentrated, desalted and reduced in chemical noise-causing components by trapping on a 7 x 300 mm Hamilton PRP-1 column. The eluent from 5 the trapping column containing the individual addition compounds was freeze-dried to yield the final isolates. Peak 1 addition compound was 99% pure and Peak 2 addition compound was >99% pure by analytical HPLC. Peak 3 addition compound was 81% pure by analytical HPLC.

Analytical HPLC was also used to collect analytical scale peak cuts for mass 10 spectrometric analysis on a PE Sciex Q-Star Qq-TOF mass spectrometer. Survey and product ion scans, as well as high resolution mass measurements for empirical formula determination were acquired in  $\mu$ ESI (micro-electrospray ionization) mode. High resolution mass spectral information on Peak 1 and Peak 2 addition compounds were obtained on a Finnigan MAT-900ST mass spectrometer operating in  $\mu$ ESI mode. 15 Accurate mass measurement for Peak 1 addition compound was carried out by linear E-scan peak matching at a resolution of 7,400 ( $m/\Delta m$  10% valley definition) using the reference ions from PEG-400,  $(C_2H_4O)_9H_2ONa$  at 437.23627 and  $(C_2H_4O)_{10}H_2ONa$  at 481.26248 daltons, respectively, to match against the sample pseudo-molecular ion. Accurate mass measurement for Peak 2 addition compound was carried out by linear 20 E-scan peak matching at a resolution of 7,100 ( $m/\Delta m$  10% valley definition) using the reference ions from PEG-400  $(C_2H_4O)_8H_2ONa$  at 393.21005 and  $(C_2H_4O)_9H_2ONa$  at 437.23627 daltons, respectively, to match against the sample pseudo-molecular ion.

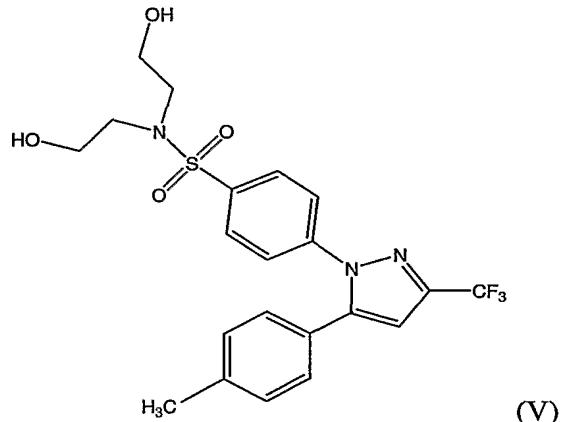

NMR samples were prepared in a nitrogen glove box and dissolved in 150  $\mu$ l 25 dimethyl sulfoxide- $d_6$ . Data were acquired on a Varian INOVA 400 NMR spectrometer operating at a proton frequency of 399.80 MHz, and equipped with a Nalorac inverse geometry, micro-gradient probe. Experiments were used directly from the vendor's standard library with no modifications.

#### Peak 1

Celecoxib and Peak 1 addition compound were individually mounted on gold- 30 coated microscope slides for IR and Raman analyses. Micro-IR specular reflectance data were collected from  $4000 \rightarrow 650 \text{ cm}^{-1}$  at  $4\text{-cm}^{-1}$  resolution on a Nicolet 760 spectrometer equipped with a liquid nitrogen cooled MCT detector. Sensitivity,

expressed as instrument gain, was 8. Data were processed as a Fourier transform utilizing a Happ-Genzel apodization function and plotted as % transmittance *vs.* frequency. The final spectra were the sum of 200 individual scans. Micro-Raman data were collected from  $3700 \rightarrow 100 \text{ cm}^{-1}$  on a Nicolet 960 FT-Raman spectrometer, 5 equipped with a liquid nitrogen cooled germanium detector. Sensitivity, expressed as instrument gain, was 64. Data were processed as a Fourier transform utilizing a Happ-Genzel apodization function and plotted as absorbance *vs.* frequency. The final spectra were the sum of 10,000 individual scans.

The molecular weight of Peak 1 addition compound was found to be 469 10 daltons, 88 daltons heavier than celecoxib and indicative of addition of two ethanolic moieties. The molecular weight was confirmed by high resolution peak matching, of an analytical peak cut, as 469.12831 daltons, within 0.2 ppm of theory for  $\text{C}_{21}\text{H}_{22}\text{F}_3\text{N}_3\text{O}_4\text{S}$ . The accurate mass of Peak 1 addition compound, less the ionizing proton, was measured as 469.12826 daltons. The empirical formula for best fit using 15 the valence rules was  $\text{C}_{21}\text{H}_{22}\text{F}_3\text{N}_3\text{O}_4\text{S}$  and within 0.1 ppm in mass from theory, thus confirming the molecular weight of this product. Peak 1 addition compound is believed to be N,N-bis(2-hydroxyethyl)-4-[5-(4-methylphenyl)-3-(trifluoromethyl)-1H-pyrazol-1-yl]benzenesulfonamide, having the structure (V):

20 NMR analysis of Peak 1 addition compound produced similar data to those for the bulk drug. A major difference existed in the absence of the  $-\text{SO}_2\text{NH}_2$  protons, and the inclusion of resonances consistent with the presence of two  $-\text{CH}_2\text{CH}_2\text{OH}$  functionalities. The methylene protons and carbons exhibited distinct chemical shifts 25 that are consistent with the proposed structure.

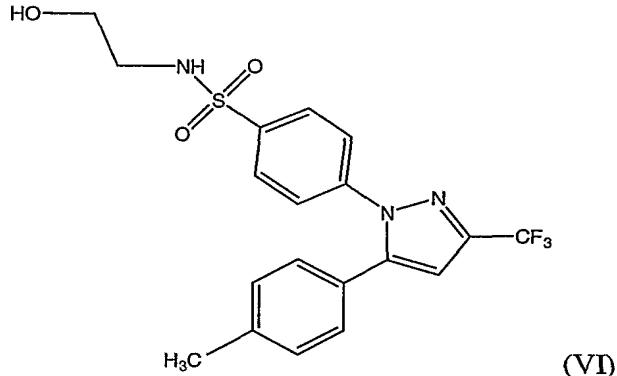

The IR and Raman spectra of celecoxib and Peak 1 addition compound are very similar, indicating that the bulk of the structure is the same as that of celecoxib. Several spectral differences, however, between the two molecules are evident. The two N-H stretching vibrations in the spectrum of celecoxib at 3236 and 3342  $\text{cm}^{-1}$  are 5 missing in the data for Peak 1 addition compound, indicating the amino group present in celecoxib is not present in Peak 1 addition compound. The N-H vibrations in the IR spectrum for celecoxib are replaced by an intense, broad absorbance centered at 3430  $\text{cm}^{-1}$  in the analogous data for Peak 1 addition compound. This broad band is typical of an O-H stretch, but is much too intense to result from a single hydroxyl 10 group, indicating that Peak 1 addition compound possesses at least two OH groups, in place of the NH<sub>2</sub> group present in celecoxib. Another major spectral difference between the vibrational spectra for celecoxib and Peak 1 addition compound are the presence of Raman C-H stretching vibrational bands for Peak 1 addition compound at 2967 and 2991  $\text{cm}^{-1}$  that are not present in the analogous data for celecoxib. These 15 differences indicate the presence of additional CH<sub>2</sub> groups in the addition compound, compared to celecoxib. Both the IR and Raman data are consistent with the proposed structure.

The compound having the structure (V) is believed to be new and is useful as an analytical marker, for example in detecting stability of celecoxib in pharmaceutical 20 compositions where the celecoxib is or has been exposed to polyethylene glycol or ethylene oxide, and/or as a selective cyclooxygenase-2 inhibitory drug or a pro-drug thereof.

#### Peak 2

The molecular weight of Peak 2 addition compound was found to be 425 25 daltons, 44 daltons heavier than celecoxib and indicative of the addition of one ethanolic moiety. The molecular weight was confirmed by high resolution peak matching, of an analytical peak cut, as 425.10239 daltons, within 0.9 ppm of theory for C<sub>19</sub>H<sub>18</sub>F<sub>3</sub>N<sub>3</sub>O<sub>3</sub>S. The accurate mass of Peak 2 addition compound, less the ionizing proton, was measured as 425.10168 daltons. The empirical formula for best 30 fit using the valence rules was C<sub>19</sub>H<sub>18</sub>F<sub>3</sub>N<sub>3</sub>O<sub>3</sub>S and within 1.0 ppm in mass from theory, thus confirming the molecular weight of this compound. Peak 2 addition compound is believed to be N-(2-hydroxyethyl)-4-[5-(4-methylphenyl)-3-

(trifluoromethyl)-1H-pyrazol-1-yl]benzenesulfonamide, having the structure (VI):

The NMR data for Peak 2 addition compound were similar to those for Peak 1  
 5 addition compound in that this isolate also exhibited the -CH<sub>2</sub>CH<sub>2</sub>OH functionality,  
 but proton integrations identified the presence of only one ethanol substituent. The  
 presence of an -NH- group was also apparent in the proton spectrum. The proton and  
 carbon chemical shifts were in accordance with the proposed structure.

The compound having the structure (VI) is believed to be new and is useful as  
 10 an analytical marker, for example in detecting stability of celecoxib in pharmaceutical  
 compositions where the celecoxib is or has been exposed to polyethylene glycol or  
 ethylene oxide, and/or as a selective cyclooxygenase-2 inhibitory drug and/or a pro-  
 drug thereof.

Peak 3

15 Peak 3 addition compound was present in insufficient concentration for an  
 adequate isolate to be obtained for spectroscopic analysis.

Example 4

Three celecoxib (10 mg/g) solutions (with methanol as solvent), one  
 containing no peroxide (S1), one containing 150 ppm hydrogen peroxide (S2), and  
 20 one containing 150 ppm *t*-butyl-peroxide (S3), were prepared. HPLC analysis, as  
 described in Example 2, was performed to determine the presence or absence of  
 impurities following storage at different temperatures for various periods of time  
 (Table 4).

**Table 4. Chemical stability of celecoxib solutions S1–S3**

Solution	Time	Total impurity level (%)		
		4°C	25°C	50°C
S1	0	0.15	0.15	0.15
	1 week	0.15	0.15	0.54
	2 weeks		0.14	1.57
	3 weeks, then 3 days at 70°C			2.40
S2	0	0.15	0.15	0.15
	1 week	0.15	0.15	0.46
	2 weeks		0.14	0.94
	3 weeks, then 3 days at 70°C			1.60
S3	0	0.15	0.15	0.15
	1 week	0.15	0.15	0.33
	2 weeks		0.13	0.92
	3 weeks, then 3 days at 70°C			2.00

These data indicate that the presence of hydrogen peroxide or *t*-butyl-peroxide at a concentration of 150 ppm does not affect celecoxib stability in methanol. These data are consistent with the conclusion that chemical instability in a system comprising an aminosulfonyl-comprising drug, for example celecoxib, and a polyethylene glycol, is not peroxide-mediated.

5 comprising an aminosulfonyl-comprising drug, for example celecoxib, and a polyethylene glycol, is not peroxide-mediated.

#### Example 5

Two celecoxib solution formulations, SF-7, and SF-8, and two vehicle (placebo) solution formulations, SF-9 and SF-10, were prepared having components 10 shown in Table 5.

**Table 5. Composition (mg) of solution formulations SF-7 to SF-10**

Component	SF-7	SF-8	SF-9	SF-10
Celecoxib	200	200		
Water USP	26	26	26	26
HPMC (E5)	38		38	
Ethanol	113	100	113	100
PEG-400	271	322	271	322
Polyvinylpyrrolidone	47	47	47	47
Polysorbate 80	217	217	217	217
Tromethamine	26	26	26	26
Oleic acid	61	61	61	61
Propyl gallate NF	1	1	1	1
<b>Total</b>	<b>1000</b>	<b>1000</b>	<b>800</b>	<b>800</b>

After storage for 90 days at different temperatures, the fraction of the initial

1 mg/g propyl gallate remaining in each formulation was measured via gradient HPLC. Samples of all formulations were dissolved in methanol to obtain a suitable concentration prior to injection. Chromatographic conditions were as follows: (a) flow rate: 1 ml/min.; (b) detection: UV 254 nm; (c) injection volume: 15  $\mu$ l; (d) 5 column: 3.5  $\mu$ m Zorbax XBD-C8, 50 x 4.6 mm; (e) column temperature: 25°C; (f) mobile phase A: 0.1% TFA in water; (g) mobile phase B: 0.1% TFA in acetonitrile; (h) running time: 16 minutes. Data are shown in Table 6.

**Table 6. Loss of propyl gallate in solution formulations SF-7 to SF-10 after storage for 90 days**

Temperature (°C)	Propyl gallate (% of theoretical) remaining			
	SF-7	SF-8	SF-9	SF-10
4	87	104	108	126
25	42	74	36	66
40	10	33	10	24
50	0	13	0	19
70	0	0	0	7

10 These data indicate that, in formulations comprising an aminosulfonyl-comprising drug (celecoxib in the present example) and in those without such a drug, propyl gallate is consumed at a substantially equal rate over 90 days. Moreover, the rate of consumption is temperature dependent with increasing rate as temperature increases. These results suggest that the free radical-scavenging antioxidant is 15 consumed via a non drug-mediated mechanism, and support the present theory that drug stabilization results from an interaction between polyethylene glycol degradation products and the free radical-scavenging antioxidant.

**Example 6**

20 A celecoxib solution formulation, SF-11, was prepared having the composition shown in Table 7.

**Table 7. Composition (mg/g) of celecoxib solution formulation SF-11**

Component	SF-11
Celecoxib	200
Water USP	26
HPMC (E5)	38
Ethanol	113
PEG 400	271
PVP	47
Polysorbate 80	217
Tromethamine	26
Oleic acid	61
Propyl gallate NF	1
Total	1000

One gram of formulation SF-11 was individually placed into each of several hard gelatin capsules (Capsugel) to form Test Composition 1.

A celecoxib suspension for comparative purposes was prepared as follows:

- 5        A. Tween™ 80, 5.0 g, was placed in a volumetric flask.
- B. Ethanol was added (to 100 ml) to form a mixture and the mixture was swirled to form a uniform solution.
- C. A 5 ml aliquot of the uniform solution was transferred to a fresh 100 ml bottle containing 200 mg celecoxib, to form a premix.
- 10      D. Apple juice, 75 ml, was added to the premix to form an intermediate celecoxib suspension.
- E. The intermediate celecoxib suspension was left to stand for 5 minutes, and was then shaken to form a celecoxib suspension for comparative purposes.
- 15      Bioavailability parameters resulting from administration of Test Composition 1, in comparison with the comparative celecoxib suspension composition of Example 5 and with a commercial celecoxib (Celebrex® of Pharmacia) 200 mg capsule, to human subjects were evaluated in a 24-subject, randomized, four period, balanced, crossover study. A fourth composition, not relevant to the present invention, was also included in the study but is not reported here. Study duration was approximately 15 days and subjects were randomly given one of each of the four dosage forms on days 1, 5, 9 and 12; administration of each dose was preceded by an 8 hour fasting period and was accompanied by 180 ml of water. Plasma blood levels for each subject were

measured at pre-dose and at 15, 30, 45 minutes and 1, 1.5, 2, 3, 4, 6, 8, 12 and 24 hours after dosage administration.  $C_{max}$  and AUC were calculated from the data in accordance with standard procedure in the art. As shown in Table 8, ingestion of Test Composition 1 resulted in a  $C_{max}$  more than 2.5 times greater than resulted from 5 ingestion of the comparative celecoxib suspension or the commercial celecoxib capsule. Ingestion of Test Composition 1 also resulted in an AUC 43% greater than, and a  $T_{max}$  substantially similar to, that resulting from ingestion of the comparative celecoxib suspension.

**Table 8. *In vivo* bioavailability of celecoxib in human subjects**

Parameter	Commercial capsule	Comparative suspension	Test composition 1
$C_{max}$ (ng/ml)	621	804	2061
$T_{max}$ (hr)	2.15	0.97	1.03
AUC (ng/ml)*hr	5060	4892	7593

10 **Example 7**

Two celecoxib solution formulations, SF-12 and SF-13, and two placebo solution formulations, P-2 and P-3, were prepared having compositions shown in Table 9.

**Table 9. Composition (mg) of celecoxib solution formulations SF-12 and SF-13 and placebo solution formulations P-2 and P-3**

15

Component	SF-12	SF-13	P-2	P-3
Celecoxib	100	200	-	-
Water USP	13	26	15.1	30.2
HPMC (E5)	19	38	22.1	44.2
Ethanol	56.5	113	65.7	131.4
PEG 400	135.5	271	157.5	315
PVP	23.5	47	27.3	54.6
Polysorbate 80	108.5	217	126.1	252.3
Tromethamine	13	26	15.1	30.2
Oleic acid	30.5	61	35.5	70.9
Propyl gallate NF	0.5	1	0.6	1.2
Total	500	1000	465	930

Amounts of 500 mg and 1000 mg of solution formulations SF-12 and SF-13 respectively were individually placed into each of several soft gelatin capsules to form Test Compositions 2 (100 mg celecoxib) and 3 (200 mg celecoxib), respectively. Test

Composition 4 consisted of two capsules of Test Composition 3 resulting in a 400 mg celecoxib dose. Placebo solution formulations P-2 and P-3 were filled into soft capsules corresponding in size with those containing solution formulations SF-12 and SF-13, respectively, to form Placebo Composition 2 and Placebo Composition 3.

5 A randomized, double-blind, active and placebo controlled, single-dose parallel group study was performed in order to assess the analgesic efficacy of Test Compositions 2, 3 and 4 in comparison with appropriate and visually matching placebo, in a human post-oral surgery pain model.

10 Post-surgical patients (after extraction of two or more impacted third molars requiring bone removal) who reported moderate or severe post-oral surgery pain on a categorical pain scale (CPS; 0 = no pain, 1 = mild pain, 2 = moderate pain, and 3 = severe pain), and a baseline pain intensity  $\geq 50$  mm on a visual analog scale (VAS; whereby patient locates a sliding bar representing his or her level of pain on a 100 mm horizontal scale with the left edge (0 mm) marked "no pain" and the right edge (100 mm) marked "worst pain") within 6 hours after completion of surgery were selected  
15 and randomized for study.

Each patient was randomized to one of four treatment groups (approximately 55 per group) and, 6 hours after completion of surgery, received the study medication assigned to his or her group from both Bottle A and Bottle B as shown in the  
20 medication schedule found in Table 10. Two additional compositions, not illustrative of the present invention, were also included in the study but are not reported here.

**Table 10. Schedule of study medication given to patients in treatment groups 1-4**

Treatment Group	Bottle A (1 capsule)	Bottle B (2 capsules)
<b>1. (Placebo)</b>	1 x Placebo Composition 2	2 x Placebo Composition 3
<b>2. (Test composition 2)</b>	1 x Test Composition 2	2 x Placebo Composition 3
<b>3. (Test composition 3)</b>	1 x Placebo Composition 2	1 x Placebo Composition 3 and 1 x Test Composition 3
<b>4. (Test composition 4)</b>	1 x Placebo Composition 2	2 x Test Composition 3

25 Pain was assessed at baseline (0 hour), 0.25, 0.50, 0.75, 1.0, 1.25, 1.50, 1.75, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 16, and 24 hours after administration of study medication. Each patient individually determined and recorded time to perceptible pain relief and time to meaningful pain relief, using two stopwatches.

Time to onset of analgesia was then calculated for each patient by performing

a time-to-event analysis combining data from patient's stopwatch assessments of time to perceptible and meaningful pain relief. Baseline pain intensity for each group is shown in Table 11. Median time to onset of analgesia is shown in Table 12.

**Table 11. Baseline pain intensity**

Pain Scale	Test Composition 2	Test Composition 3	Test Composition 4
CPS		( % )	
Moderate	56	56	57
Severe	44	44	43
VAS	<b>0 to 100 mm</b>		
Mean	73.29	72.78	73.86

5 These data show that patients in each test group had comparable baseline pain intensity.

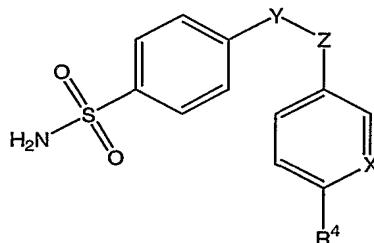

**Table 12. Median time to onset of analgesia**

Treatment	Time (min)
Placebo	>1440
Test Composition 2	31
Test Composition 3	28
Test Composition 4	31

As determined in a similar pain study reported in International Patent Publication No. WO 01/91750, incorporated herein by reference, 200 mg Celebrex® 10 capsules exhibit a median time to onset of analgesia of 41 minutes. The data in Table 12 show that patients taking Test Compositions 2, 3 or 4 experienced a relatively fast median time to onset of analgesia of 31 minutes or less.

## WHAT IS CLAIMED IS:

1. An orally deliverable pharmaceutical composition comprising (a) a drug of low water solubility in a therapeutically and/or prophylactically effective amount and (b) a solvent liquid that comprises at least one pharmaceutically acceptable polyethylene glycol and at least one pharmaceutically acceptable free radical-scavenging antioxidant, wherein a substantial portion of the drug is in dissolved or solubilized form in the solvent liquid, and wherein the drug comprises an aminosulfonyl functional group and/or is capable of reacting with a polyethylene glycol or with a polyethylene glycol degradation product to form an addition compound.
- 5 2. The composition of Claim 1 wherein the drug is a selective cyclooxygenase-2 inhibitory drug.
- 10 3. The composition of Claim 2 wherein the selective cyclooxygenase-2 inhibitory drug is a compound of formula

15 where  $\text{R}^4$  is hydrogen or a  $\text{C}_{1-4}$  alkyl or alkoxy group,  $\text{X}$  is  $\text{N}$  or  $\text{CR}^5$  where  $\text{R}^5$  is hydrogen or halogen, and  $\text{Y}$  and  $\text{Z}$  are independently carbon or nitrogen atoms defining adjacent atoms of a five- to six-membered ring that is unsubstituted or substituted at one or more positions with oxo, halo, methyl or halomethyl groups.

- 20 4. The composition of Claim 3 wherein the five- to six-membered ring is selected from the group consisting of cyclopentenone, furanone, methylpyrazole, isoxazole and pyridine rings substituted at no more than one position.
5. The composition of Claim 2 wherein the drug is selected from the group consisting of celecoxib, deracoxib, valdecoxib and JTE-522.
- 25 6. The composition of Claim 2 wherein the drug is celecoxib.

7. The composition of Claim 2 wherein the drug is valdecoxib.
8. The composition of any of Claims 2 to 7 that further comprises a vasomodulator, wherein the selective cyclooxygenase-2 inhibitory drug and the vasomodulator are present in total and relative amounts effective to relieve pain in headache or migraine.
9. The composition of any of Claims 2 to 7 that further comprises an alkylxanthine compound, wherein the selective cyclooxygenase-2 inhibitory drug and the alkylxanthine compound are present in total and relative amounts effective to relieve pain in headache or migraine.
10. The composition of Claim 9 wherein the alkylxanthine compound is caffeine.
11. The composition of any of Claims 1 to 10 wherein the polyethylene glycol has an average molecular weight of about 100 to about 10,000.
12. The composition of any of Claims 1 to 10 wherein the polyethylene glycol is of liquid grade.
13. The composition of any of Claims 1 to 12 wherein the at least one free radical-scavenging antioxidant is present in the solvent liquid in a total amount of about 0.01% to about 5%, preferably about 0.01% to about 1%, by weight of the composition.
14. The composition of any of Claims 1 to 13 wherein the at least one free radical-scavenging antioxidant is selected from the group consisting of vitamin E, ascorbic acid and salts thereof, butylated hydroxyanisole, butylated hydroxytoluene, fumaric acid and salts thereof, hypophosphorous acid, malic acid, alkyl gallates, sodium thiosulfate, sodium sulfite, sodium bisulfite and sodium metabisulfite.
15. The composition of any of Claims 1 to 13 wherein the at least one free radical-scavenging antioxidant is an alkyl gallate, preferably propyl gallate.
16. The composition of any of Claims 1 to 13 wherein the at least one free radical-scavenging antioxidant is vitamin E.
17. The composition of any of Claims 1 to 16 wherein substantially all of the drug

present in the composition is in dissolved or solubilized form.

18. The composition of any of Claims 1 to 17 wherein the solvent liquid further comprises a turbidity-decreasing polymer.
19. The composition of Claim 18 wherein the at least one turbidity-decreasing polymer is hydroxypropylmethylcellulose.
20. The composition of any of Claims 1 to 19 wherein the solvent liquid further comprises at least one pharmaceutically acceptable fatty acid and at least one pharmaceutically acceptable organic amine.
21. The composition of Claim 20 wherein the at least one fatty acid is oleic acid.
22. The composition of Claim 20 or Claim 21 wherein the at least one organic amine is a tertiary amine selected from the group consisting of triethanolamine and dimethylaminoethanol.
23. The composition of any of Claims 1 to 22 that comprises one or more discrete dose units, wherein a therapeutically and/or prophylactically effective amount of the drug is contained in one to a small plurality of said dose units.
24. The composition of Claim 23 wherein each dose unit is a liquid-filled capsule having a capsule wall.
25. The composition of Claim 24 wherein the capsule wall comprises a turbidity-decreasing polymer.
26. The composition of Claim 25 wherein the turbidity-decreasing polymer is hydroxypropylmethylcellulose.
27. A method of treating a medical condition or disorder in a subject where treatment with a cyclooxygenase-2 inhibitor is indicated, comprising orally administering to the subject a composition of any of Claims 2 to 10.
28. A method of analgesia comprising orally administering an effective pain-relieving amount of a composition of any of Claims 2 to 7 to a subject in need of analgesia.
29. The method of Claim 28 wherein the subject suffers from headache or migraine and wherein there is further orally administered to the subject a vasomodulator,

the selective cyclooxygenase-2 inhibitory drug and the vasomodulator being administered in total and relative amounts effective to relieve pain in the headache or migraine.

30. The method of Claim 28 wherein the subject suffers from headache or migraine  
5 and wherein there is further orally administered to the subject an alkylxanthine compound, the selective cyclooxygenase-2 inhibitory drug and the alkylxanthine compound being administered in total and relative amounts effective to relieve pain in the headache or migraine.
31. A method of use of a composition of any of Claims 2 to 7 in manufacture of a  
10 medicament useful for treating a medical condition or disorder in a subject where treatment with a cyclooxygenase-2 inhibitor is indicated.

## Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1.  Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely:  

Although claims 27-30 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2.  Claims Nos.: because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:  

see FURTHER INFORMATION sheet PCT/ISA/210
3.  Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1.  As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2.  As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3.  As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4.  No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

### Remark on Protest

The additional search fees were accompanied by the applicant's protest.

No protest accompanied the payment of additional search fees.

## INTERNATIONAL SEARCH REPORT

International Application No. PCT/US 02 A1690

### FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

#### Continuation of Box I.2

The subject-matter of present claims 1 and 2 (and the claims dependent thereupon) is defined by means of functional features:

- \* '...wherein the drug comprises an aminosulfonyl functional group and/or is capable of reacting with a polyethylene glycol or with a polyethylene glycol degradation product ...'
- \* 'a selective cyclooxygenase-2 inhibitory drug'

Present claims 1 and 2 and the dependent claims 8-31) relate to an extremely large number of possible compounds. Support within the meaning of Article 6 PCT and/or disclosure within the meaning of Article 5 PCT is to be found, however, for only a very small proportion of the compounds claimed. In the present case, the claims so lack support, and the application so lacks disclosure, that a meaningful search over the whole of the claimed scope is impossible. Consequently, the search has been carried out for those parts of the claims which appear to be supported and disclosed, namely those parts relating to the compounds defined by means of the Markush-formula given in claim 3 and the particular compounds defined in claim 5.

The applicant's attention is drawn to the fact that claims, or parts of claims, relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure.
